2. Mysono 201 Compatibility Matrix
1. What is Mysono201?

- Mysono201 manufactured by Medison Co., Ltd is the newest subminiature and portable ultrasound system with high resolution, deep transmission and variable function for measurement.
- The several probes such as Curved probe, Linear probe are available for wide usage. Mysono201 can be used in a variety of applications Abdomen, Obstetrics, Gynecology, Vascular, Extremity, Pediatric, Cardiac, Urology.
- Mysono201 offers to excellent image quality, several measurement functions such as a standards distance, area, girth, volume by application for Obstetrics, Cardiac, etc.
2. System constitution

The system consists of main body, monitor, probe, accessory, etc.

MEDISON or local distributor will make available on request circuit diagrams, components part list, descriptions, calibration instructions or other information which assist your appropriately qualified technical personnel to repair those parts of equipment which are designed by Medison as repairable

2.1 Main body

The system is classified by inside for making ultrasound image and by outside for connection to other parts. The housing of system has controllers, probe connector, connector for monitor or other accessories, handle and power switch.
2.2 Monitor

It is TFT LCD Monitor and displays ultrasound image and related information. It connects to the main body lack of which can control the angle and the height.

[Figure 1.2 LCD Warning]

[Figure 1.3 LCD Warning]
2.3 Probe

Probe generates ultrasound beam and gain the data for display the image.

Probe list and BIOPSY kit available Mysono201 is as follows;

Human : Image setting, Safety, EMC, AP&I, QA – Total 6 Probe Release.

2.4 Parts

There are supplied with main body.

1. Coupling gel
2. Power code
3. Power adapter
4. Battery (Option)
5. RCA Jack
6. Video output cable
7. Portable Case
8. Operation manual (User guide)
9. Smart media (Option) – available hereafter

2.5 Accessories (Option)

It is the optional accessories to connect to the main system. Please refer to supplement OB of user guide.

1. B/W Printer
2. VCR
3. Non-Interlaced B / W Monitor
4. VGA Monitor
5. VHS Monitor
6. HMD
3. Safety Precautions

[Notes to users]

Thank you for purchasing the Mysono201 Ultrasound system. To ensure safe operation and long-term performance stability, it is essential that you fully understand the functions, operating and maintenance instructions by reading this manual before operating your equipment. The system must be operated only by, or under supervision of a qualified person.

"Warning" is used to indicate the presence of a hazard that can cause severe personal injury, death, or substantial property damage if the warning is ignored.

"Caution" is used to indicate the presence of a hazard that will or can cause minor personal injury or property damage if the warnings are ignored.

"Note" is used to notify the user of installation, operation, or maintenance information that is important but not hazard related. Hazard warnings should never be included under the Note signal word.

3.1 Safety Precautions

- **Classification:**
  - Class 1 equipment with Type BF applied parts
  - Ordinary Equipment
  - Non-AP/APG

- Electromechanical safety standards met:
  - CSA C22.2 No.601.1, Canadian Standards Association, Medical Electrical Equipment
  - EN60601-1, Second Edition, including Amendments 1 and 2, European Norm, Medical Electrical
  - IEC61157: 1992, International Electro technical Commission, Requirements for the declaration of the acoustic output of medical diagnostic ultrasonic equipment
  - UL 2601-1, Underwriters Laboratories, Medical Electrical Equipment
3.2 Electrical Safety Precaution

It is classified Class I equipment with Type BF applied parts

To ensure user safety, check the following.

**WARNING**

Never open the system safety cover.;
There is a dangerous voltage in system inside. If any repairing or exchanging of parts is desired, ask to the authorized dealer for the service.
Do not place the system near of flammable gas or anesthesia gas. It has a danger of explosion.
Before using the system, check the housing and the cables. If it has any crack on the housing or wear away on cable, stop to use.
Whenever cleaning the system, take off the power code and the battery to avoid the danger of an electric shock.
To avoid the danger of an electric shock, use the standard device for digital interface of which achieved IEC certificate. (I.e. IEC60950/EN60950 for the data processing device, IEC60601-1/EN60601-1 for medical device.)
For the more, all parts of system meet standard requirement of IEC60601-1-1/EN60601-1-1.
Check whether the peripheral device of input or output port meet standard requirement of IEC60601-1-1/EN60601-1-1 when add it.
Do not connect to the system signal in/outlet and the patient at the same time.
It is for preventing to leakage current caused by over the maximum permissible range.

**CAUTION**

Even though the system passed the test of EMI/EMC standard, it could be down the image quality or could damage the system under using magnetic filed.
If you have a poor image or image problem, check whether the source of electromagnetic waves is near of the system or not such as Mobile phone, Pager, Radio, TV or Microwave machine. Please move them far from the system or move the system from affected zone of electromagnetic waves.
Electrostatic discharge (ESD) is a shock occurred by Static electricity and a phenomenon in nature. ESD occurs in dry condition such like under using heater or air conditioner.
The static electricity occurred by a user or a patient can affect to the system or the probe sometimes. To prevent this problem, please be well aware as follow.
- Spray the prevent of static electricity spray to carpet or Linoleum
- Use met for protection of static electricity
- Connect a ground between the system and table or bad for patient
3.2.1 System care

Check the following.

**CAUTION**

In case that tie too much or twist the probe connected with patient, system could be wrong work.

Wrong cleaning or sterilization of the parts connected with patient is dangerous.

Refer to "3.4 Maintenance & Cleaning" in this manual.

Do not soak the cable in liquid. It cannot prevent flood.

Do not use strong solvents such as thinner or benzene, or abrasive cleansers.

Since these will damage the cabinet.

In general, only treat with waterproof on the ultrasound lens part (Safety grade: IPX7). Do not soak the probe in liquid except the special case with cleaning guide.

Do not turn the system off under store the image. That will damage the memory inside.

Turn the system off when remove the probe form the system or connect it to the system.

Do not keep the system over one hour with close LCD monitor under the system is working. That will damage the keyboard.

**WARNING**

The turning radius is limited to suitable use. If it is over the limitation, that will damage LCD monitor.

[Safety Figure 1. Warning for LCD angle]
3.2.2 Battery

Keep in mind the warning and caution to prevent explosion, heat or smoke generation in battery.

**WARNING**

- Do not disassemble or modify the battery.
- Keep the circumstance temperature condition when using the battery.
  - Charge: $0^\circ \sim 45^\circ \text{C}$
  - Discharge: $-10^\circ \sim 60^\circ \text{C}$
- Do not short between terminals of battery.
- Do not use the battery under the circumstance like as fire, moisture.
- Do not charge the battery where is near of fire or heater.
- Keep out of the sun when keep the battery.
- Keep out the sharp material to face with battery and do not deliver the shock directly to it.
- Take away the battery from the system when do not use it for a long time.

**CAUTION**

- Do not use the battery except supplied by Medison
- Do not use a battery except made by Medison.
- Do not charge a battery with non- allowed method.
  (Don't use other charge method)
- Keep a battery from moisture.
- If smell or burn under using battery, discontinue use of system prompt, remove a battery.
- Keep the battery under the circumstance temperature $-20^\circ \sim 50^\circ \text{C}$.
- System working condition and a number of charge/discharge times of battery affect to time of charge/discharge.
- Medison guaranty the battery during 6 month (battery capacity 50%).
3.2.3 Safety Symbols

The international Electrotechnic Commission (IEC) has established a set of symbols for medical electronic equipment that classify a connection or warm of any potential hazards. The classifications and symbols are shown below.

- Isolated patient connection (IEC 601-1-Type BF)
- Power Switch represent ON and OFF, respectively.
- This symbol identifies a safety note. Ensure you understand the function of this control before using it. Control function is described in the appreciate operation manual.
- Output port or Parallel port of VGA
- Output port of VHS
- Non-interlaced B/W Printer port
- Printer remote output port
- Humidity protect
3.3 Physical Safety Precaution

If you have experienced any trouble with the equipment, switch it off immediately, and contact to Service center or its authorized dealer for assistance.

Do not use the system under working wrong or trouble.

Non-continuous scanning is caused by hardware problem. It must be repaired.

The using of Ultrasound always needs a careful attention.

Under the principles of ALARA, energy delivered should be “as low as reasonably achievable” to perform study.

Read the explanation about biopsy before using it. Refer to user explanation parts of probe an appendix.

Certify biopsy Needle before using it. Do not use curved needle.

ALARA TRAINING PROGRAM

Ultrasound is considered safe at low clinical levels. At high levels and longer exposures, however, its safety is not completely understood. For this reason, always exercise caution when exposing patients to ultrasound. Always use the lowest transmit power levels.

And minimize time of exposure. Under the principles of ALARA, energy delivered should be “as low as reasonable achievable” to perform your study.

The following is a public statement by the one of United Stated Ultrasound Association, AIUM, on the safety of ultrasound diagnosis.

Ultrasound has been in use since the 1950’s. AIUM declares the clinical safety of ultrasound scanning and acknowledges its effectiveness as the type medical equipment and its possible use for diagnosis of pregnant women.

There has been no case which shows cause of any physical damage to either patient or user during properly performed diagnosis with an ultrasound scanner. Although it might be possible that unknown effects of ultrasound may come to light in the future, so far the benefits far outweigh any unproved danger. Theoretically, there are two possible ways that ultrasound could have negative affect on the human body.

One is the heat generated by ultrasound as it passes through the human body. Doppler produces the most heat, and it followed by color and B-mode imaging. However, even in the case of Doppler the amount of heat is so minor that there is no equipment that can measure it.

The other one is the possible formation of a cavity by the ultrasound. However, there has been no clear evidence that this can actually occur in the human body.

In conclusion, no negative biological effects of ultrasound have been proven thus far.
3.4 Maintenance and cleaning

WARNING Whenever maintain or clean the system, turn off the power and remove the plug from the power supply. (Remove the battery from the system, too)

3.4.1 Probe

WARNING Always use protective eyewear and gloves when cleaning and disinfecting probes and Biopsy guide adapter.

CAUTION Probes must be cleaned after each use. Cleaning the probe is an essential step prior to effective disinfection or sterilization. Be sure to follow the manufacturer's instructions when using disinfectants.
Do not allow sharp objects, such as scalpels or cauterizing knives, to touch probes or cables.
When handling a probe, do not bump the probe on hard surfaces.

Probe is very important part to judge the image quality. The optimum image can display under using the correct probe.

3.4.1.1 Cleaning

CAUTION Do not use lacquer thinner ethylene oxide or any other organic solutions, as these can destroy the membrane of the probe.
Do not use a surgeon's brush when cleaning probes. The use of even soft brushes can damage the probe.
During cleaning, disinfection, and sterilization, orient the parts of the probe that must remain dry higher than the wetted parts until all parts are dry. This will help keep liquid from entering non-liquid-tight areas of the probe.

1) Disconnect the probe from the system.
2) Remove any sheaths, biopsy guide adapters, or biopsy needle guides (biopsy guide adapters are re-usable portion of the biopsy guide and can be sterilized.)
3) Discard sheaths (sheaths are single-use item)
4) Use a soft cloth lightly dampened in a mild soap or compatible cleaning solution to remove any particulate matter or body fluids that remain on the probe or cable.
5) To remove remaining particulates, rinse with water up to the immersion point.
6) Wipe with a dry cloth; or wipe with a water-dampened cloth to remove soap residue, and then wipe with a dry cloth.
### 3.4.1.2 Sterilization

Apply this sterilization way to EC4-9/13CD probe only.

A $10^{-6}$ reduction in pathogens should be reached following the sterilization procedures in this manual and using the following MEDISON recommended solutions. The following disinfectants are recommended because of both its biological effectiveness (as qualified through the FDA 510(k) process) and its chemical compatibility with MEDISON ultrasound product materials.

<table>
<thead>
<tr>
<th>Solution</th>
<th>Country</th>
<th>Type</th>
<th>Active ingredient</th>
<th>FDA 510(k)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cidex</td>
<td>USA</td>
<td>Liquid</td>
<td>Gluteraldehyde</td>
<td>K934434</td>
</tr>
</tbody>
</table>

**WARNING**

If a pre-mixed solution is used, be sure to observe the solution expiration date. The level of disinfection required for a device is dictated by the type of tissue it will contact during use. Ensure that the solution strength and duration of contact are appropriate for disinfection or sterilization. Be sure to follow the manufacturer's instructions.

In neurosurgical application, sterilized probes should be used with a pyrogen-free sheath.

**CAUTION**

Using a non-recommended disinfection solution, incorrect solution strength, or immersing a probe deeper or for a period longer than recommended can damage or discolor the probe and will void the probe warranty.

Do not immerse probes longer than one hour, unless they are sterilizable. Probes may be damaged by longer immersion times.

Sterilize probes using only liquid solutions. Using autoclave, gas(EtO), or other non-MEDISON-approved methods will damage your probe and void your warranty.

7) Mix the disinfection solution (or sterilization solution, for sterilizable probe) compatible with your probe according to label instructions for solution strength. A disinfectant qualified by the FDA 510(k) process is recommended.

8) Immerse the probe into the disinfection solution (or sterilization solution, for sterilizable probe) as shown in the figures below for your probe.

9) Follow the instructions on the disinfection (or sterilization, for sterilizable probe) label for the duration of probe immersion. Do not immerse probes longer than one hour, unless they are sterilizable.

10) Using the instructions on the disinfectant or sterilization label, rinse the probe up to the point of immersion, and then air dry or towel dry with a clean cloth (or a sterile cloth, for sterilizable probe).

11) Examine the probe for damage such as cracks, splitting, fluid leaks, or sharp edges or projections. If damage is evident, discontinue use of the probe and contact your customer service representative.
3.4.2 Biopsy guide adaptor and Needle guide

The reusable external surface of biopsy guide adaptor can sterilize under the condition as below. It is possible to reduce the pathogens up to $10^{-6}$ as following process.

**WARNING**
Gloves and safety mask should be worn during cleaning and sterilizing the probe and biopsy guide adapters.

**CAUTION**
Biopsy guide have to clean after using. It is very important process. When using the disinfecting solution, follow the user guide published by manufacturer. Keep out of the sharp things such like a mess for a surgical operation. Be careful to avoid striking the biopsy guide with hard material.

3.4.2.1 Cleaning of the stainless biopsy guide

1) Take off the biopsy guide assembly parts from the probe after using.
2) Disassemble the biopsy guide parts each one.
3) Remove an alien substance still remained on each part using by small brush and water.
4) Rinse it with water to remove again an alien substance.
3.4.2.2 Sterilizing of the stainless biopsy guide

Sterilize it by using an autoclave or Ethylene Oxide.

1) Complete the following process after sterilization.

2) Check the biopsy guide adaptor whether it has a crack, division, or any other damage on it. If there is some damage, stop to use and contact to Medison service agency or its authorized local service agency.

3.4.2.3 Cleaning of plastic biopsy guide

Take off the biopsy guide assembly parts from the probe after using.

1) Disassemble the biopsy guide parts each one. The consumable parts cannot sterilize.

2) Remove an alien substance still remained on reusable part using by small brush and water.

3) Rinse it with water to remove again an alien substance.

3.4.2.4 Sterilizing of plastic biopsy guide

**CAUTION**

Sterilize only a chemical pasteurization at a low temperature. It can get the permanent damage by sterilization using autoclave, gas or radioactivity.

4) Sterilize it by using a chemical pasteurization at a low temperature approved by FDA 510(K). Check the time (normal 10 hours) and the temperature of solution.

It is a biologically, chemically suitable disinfecting solution approved by FDA 510(k) in U.S.A.

<table>
<thead>
<tr>
<th>Solution</th>
<th>Country</th>

<td>Liquid</td>
<td>Gluteraldehyde</td>
<td>K923744</td>
</tr>
</tbody>
</table>

5) Complete the following process after sterilization.

6) Check the biopsy guide adaptor whether it has a crack, division, or any other damage on it. If there is some damage, stop to use and contact to Medison service agency or its authorized local service agency.
3.4.3 Surface of system

Follow as below..

**WARNING**  Gloves and safety mask should be worn during cleaning and sterilizing the surface of system.

**CAUTION**  Use only the solution recommended by Medison.

3.4.3.1 Cleaning

1) Turn the system off and then remove the plug from the power source.
2) Use a soft cloth lightly moistened with a mild soap or detergent solution to clean the system surface.

3.4.3.2 Sterilization

3) Use a disinfecting solution with suitable concentration recommended by user guide. Medison recommend the solution approved by FDA 510(k) in U.S.A.
4) Check the using time and the concentration of the solution as following the caution on the label.
5) Dry it with a soft sterile cloth.
4. Installation of Mysono201

4.1 Connecting and removing the probe

The system has only one probe connector.

- How to connect the probe
  1) Connect the probe to the probe connector located at the right side of the system.
  2) Turn the locking lever on the probe connector clockwise to fix the probe.

- How to remove the probe
  1) Turn the locking lever on the probe connector counter-clockwise to remove the probe.
  2) Take off the probe from the system.

4.2 Connecting and removing the battery

It is optional part to supply the battery.

- How to connect the battery
  1) Remove the cover of battery connector located at the bottom of system by pushing forward outside.
  2) Insert the battery to the battery connector by matching the bottom of the battery and the system. After fixing the location of the connector pin between the battery and system, press it softly until complete the connection.
  3) After complete connection, close the cover of battery connector of the system.

- How to remove the battery
  1) Turn off the system power.
  2) Remove the cover of battery connector located at the bottom of system by pressing forward outside.
  3) Take hold of the battery handle and lift it slightly. Then push it forward outside of the system.
  4) After remove the battery, close the cover of the system battery connector.

4.3 Charge and discharge of the battery

The battery has to charge before using.

- How to charge the battery
  1) Insert the battery as how to connect the battery
  2) Connect the system and AC adaptor supplied with the system. Refer to [appendix 0b. connecting the peripheral device] in user manual.
  3) The battery is charging during AC adaptor connecting.
    It is possible to charge under the state both the system on and off.
In case of the system on, it takes about 5 hours to charge.
In case of the system off, it takes about 3 hours to charge.
If need a more information of the time for charge or discharge, refer to [Appendix C. System specification] in the user manual.

Check the battery state by LED color on the system during charging.
- Without Battery: No Color
- Under charging: Orange
- Complete charging: Yellow
- Take off the adaptor: Red

Discharge the battery
When the battery is discharged (the system is working without AC adaptor), the system power will be compulsorily turned off after a period of time (90 minutes) for safety and efficiency of battery and user will hear the warning “beep” sound every 10 seconds.

4.4 Power ON / OFF
Hold the pressing the power switch located at the left side of the system for minimum 1sec. whenever turns on/off the system. It is to prevent the system down and battery discharge.

- How to turn on the system
  1) Hold the pressing the power switch for minimum 1sec. with connecting the AC adaptor or inserting the charged battery.
  2) Check the image display on the monitor.

- How to turn off the system
  1) Hold the pressing the power switch for minimum 1sec.
  2) Check the image disappears on the monitor and switch off.

4.5 Using AC adaptor
It takes about 5 hours to charge completely under connection of AC adaptor to the system. Refer to [Appendix 0b. connecting the peripheral device] in user manual.

1. System Block Diagram

![System Block Diagram]

**System Block Diagram**
2. Front-End Board (F/E)

2.1 General Description

F/E board receives the echo signal of ultrasound and the signal clamps the high voltage to +/- 0.6 V by Limiter then pass through TGC Amp. And then it reordering and its signal path is reduced in half by OP Amp Adder that add the Symmetrical signal per scanline. Then, to reduce the Aliasing, pass through the Low pass Filter and travels it to Beamforming IC after converting it to A/D. Beamforming IC control the signals of 8 channel by Rx focusing, and forward them to Mid Processor IC MGA015A on DSC.

Its main components are:

- MOSFET Driver EL7222 x 16 ea
- PMOS TP2520 x 16 ea
- NMOS TN2524 x 16 ea
- Dual TGC Amp AD604 x 8 ea
- Cross Point Switch (16 x 8) MT8816 x 1 ea
- OP Amp AD812 x 8 ea
- Beamforming IC MCB014A x 2 ea
- XC95144 for Control x 1 ea

2.6 Detail Description

2.6.1 TGC Amp

The main chip of TGC Amp is AD604. Two Variable Gain Amp is located inside of the chip and they are composed of 2 channels TGC Amp. The ultrasound signal that was reflected or propagated from a medium can compensate by Variable Gain as time, that is to say it is a proceeded distance, at this stage.

- **Gain Range**: 0 ~ 48 dB (Preamp Gain = +14 dB)
- **Input resistance**: 300 kohm
- **Variable Gain Scaling**: 20 dB/V
- **Gain [dB]**: \(20\text{[dB/V]} \times \text{TGC\_Curve[v]} - 5\) [dB]
- **Output Impedance**: 2 ohm
- **Load resistance**: > 500 ohm
- **Reference Voltage**: 2.5V (Gain Scaling 20 dB/V)

2.6.2 Reordering

One MT8816 generate 16 ×8 MUX.

It is controlled by Scan Lind regardless TX Focal Point or Probe type.

[Normal Tx Mode]

The ultrasound signal symmetrically controls the reordering around Center Element. But at the point of BFIC Channel, the Center of signal could be moved as Scanline because it has sixteen MUX (6x1) as High Voltage Switching IC in the Probe Box. Thus it is possible to control BFIC RX Control date size by reordering this signal.
[Synthetic Tx mode]
To achieve 1 scanline image, the element that used Tx or Rx is the same in Normal Tx mode.
Under Synthetic Tx mode, it is the same as Tx element but RX receive the first signal from the center 16 elements and receive again the second signal from the near side 16 elements. As the result, RX generate 32 channel image in MGA015A Mid Processor ASIC by adding two scanline Beamforming data in RF domain

2.6.3 LPF
Low-Pass Filter located the edge of the Analog Receiver Channel is worked both noise suppression as stop band and Anti-aliasing Filter as reduce aliasing caused by high frequency probe such as 7.5MHz Probe

[Figure 5. Low-Pass Filter]
A/D clock is 25.2 MHz and maximum center frequency of probe is 7.5MHz.
And 3dB cut off frequency for Trade-off is 10MHz.
LPF works as Bessel filter and constructs the circuit by 4th step for reducing a ringing.

2.6.4 Beamforming IC MCB014A
For Reordering, it is necessary 8 Channel A/D Converters. BFIC has 4 Channels. To make a Beamforming, two BFICs are required.
Tow’s Compliment is output and Bit 1 to 16 is used at the last output.

Both of main clock and the last output data rate are 25.2Mhz. It is possible to control Tx Delay by twice frequency and to control Tx Period under 25.2MHz, 40nsec.
To prepare the next calculation of scanline during Beamforming, have to provide the next scanline between /RPT rising point and /ETRG rising point.

3. DSC Board

3.1. Description Overall

- B/F data pass to FIFO through MID Processor and the data is sampling by ADCLK on Clock Generator (MGA003) and then transfer to Frame Average (MGA001).
- MGA003 generates the Clock by integrating the standard signal (/OF, /RP, /EADC) come from RTC Controller (FPGA0), Sampling Clock information as Scan Line inside SCG•DCG ROM and Display Clock information.
- MGA001 works as Frame Average Function by using /OF, /RP, /EADC come from RTC Controller (FPGA0) under controlling Frame GDC, and then transfer the data to Frame Memory and Cine Memory.
- In Real mode, the data come from MGA001A is stored both Frame Memory and Cine Memory simultaneously. But the data come from Frame Memory transfer to CRD (MGA005).
- In Cine mode, the data come from MGA001A is not transfer either Frame Memory or Cine Memory and the data stored in Cine Memory pass to CRD (MGA005) and display on the screen.
- The Port out Command in CPU of Cine Controller (FPGA1) control the Cine Memory.
- The data come from Frame Memory (or Cine memory) is variable DCG rate each H-Sync. CRD (MGA005) interpolate it by 12.6MHz unit in 1D (Horizontal Interpolation) and make a data as equal then pass it to Post Memory for displaying.
- Port out command of CPU input into Overlay GDC. Overlay GDC generates Overlay data and then pass them to Post memory. And generate the general Control signals that are necessary in Overlay.
- Post Memory integrates the data come from CRD and Overlay GDC and makes the image adapted on 640x480. Then pass it to Video Buffer (AL422) and display it on the LCD (or Monitor).
- Video Buffer (AL422) receive the control signals come from Video Output Controller to adjust Refresh Rate of LCD (or Monitor) and output the Image data as 25.2MHz and then transfer them to DAC (TDA8775).

- NOTE: Refer to Article 5. in chapter 2. [ASIC PIN definition]
3.4 Detail Description

3.4.1 B/W Data Receiving & FM Storing Part

3.4.1.1 Mid-Processor (MGA015A)

- Mid-processor plays as converter RF data come from F/E board into BW data that can use in DSC pass through several digital signal processing.

- MGA015A ASIC clock divides system master clock 50.4MHz into 25.2MHz on MGA003 and pass through it to Clock buffer. As the result, it uses 25.2MHz.

- The data of Internal MGA015A is controlled by CPU Portout downloading. Host controller (FPGA1–host data, host address, host_wr, host_rd) works as the download interface.

- RF data, the first TX/RX result come from B/F, is stored SRAM in MGA015A. But external SRAM is necessary to display BW data that generated by summing up the second R/F data of TX/RX result.

- MGA015A makes /BW_CLK_0 that 74HCT574 located on the back stage is to latch the BW data. But because /BW_CLK_0 do not make any clock during /RP blank period, /RP the last data remain in 74HCT574. Thus the first sampling data in /RP enable period is possible to be the last data during hole /RP period. As the result, white spot symptom appears at near part on the image. To remove this symptom, use /MOD_BW_CLK_0 include dummy clock. It clears 74HCT574 data within RP blank period.
Figure 1. Mid-Processor (MGA015)
### 3.4.1.2 Pattern generator

- FPGA0 drives Pattern generator.
- Pattern generator is a block that makes a test pattern to check DSC function whether it works well or not.
- According to test pattern on/off, change from /BW_OUT_EN to /BW_TST_EN.
- Test pattern on/off is set by CPU portout.

#### 3.4.1.3 Before FM controller (MGA001)

- BW data sampling get according to /AD_LATCH_CLK.
- /AD_LATCH_CLK is a clock that generated by masking ADCLK come form MGA003 into /EADC.
- Master reset of 74HCT27 is achieved by /AD_LATCH_CLR_OUT. /AD_LATCH_CLR_IN signal generated by MGA003 match the BW data sampling point as masking /BW_RDY.
- Frame memory FIFO stores the BW data with scanline direction temporary and support to write the data on the Frame memory. To match the timing point, FIFO write clock uses an inverter type of /AD_LATCH_CLK.
- The clock that read Frame Memory FIFO receive the BW data using /EMPTY_FLAG. /ACK is a clock to read Frame FIFO and receive BW data using REQ and /EMPTY_FLAG.
- REQ represent whether MGA001 is ready to BW data process and /EMPTY_FLAG check whether the FIFO is empty.
3.4.1.4 FM controller (MGA001)

- MGA001 for exclusive use of FMC design to generate several signals under ASIC Technology.
- The related signals of Frame memory are DATA & Address Bus, Control signal such as /RAS, /CAS, /OE, /WE, etc.
- Data Bus of Frame memory is connected with Frame Average Logic at chip inside and average factor is 6ea. Mysono201 used 4ea among them.
- MGA001 use two clocks. Master clock is 50.4MHz and 6.3MHz clock same as Frame GDC. In case of 6.3MHz clock, use 6.3MHz half clock of MGA003 with the result of passing through inverter twice since clock slew rate is not fine.
- Frame GDC generate the standard signals such as FM_GDC_HS, FM_GDC_BLK, /FM_GDC_RAS, /FM_GDC_DBIN and perform the factor data and functions. However, for /FM_GDC_RAS signal, use /FM_GDC_RAS_LATCH signal with latching the rising edge as 50.4MHz to match the necessary point at MGA001.
- FMC is connected with address bus and data bus for Frame memory.
  In M-mode, to store a designated scanline data in a designated FM address, the latch that portout the address form CPU is connected with address bus.
- M mode CPU portout latch output and 245buffer output of FMC address bus are working as either enabling or switching by BADDR_EN and /MADDR_EN that use integrating the signals come from MGA001 such as /DSP, /GDC, /ADDR_SEL, /M_ENA, /REAL according to mode status.

</tbody>
</table>

- Operation for writing on Frame memory is achieved by MGA001 control signal such as /R_RAS, /R_CAS, /LM_WE, /RM_WE, etc.
- Operation for reading on Frame memory is recognized by Display clock at SAM. (cf. VRAM = DRAM + FIFO) And latch it by 573 latch data.

3.4.2.2 Cine Memory (DRAM)

- Cine memory store total 32 frame and use for image store include Cine image.
- Cine memory controller (FPGA1) controls the cine memory.
- Under Real mode, Cine memory is stored with Frame memory at the same time using the data come from FMC directly and control signal such as /R_RAS, /R_CAS, /RM_WE, /LM_WE. But under Cine mode, data is output from Cine memory instead of FM and connected with Cine memory FIFO of DRAN back stage to work as VRAM.
- Frame memory data path and Cine memory data path meet at Data bus, called S_OUT.
  And 573 latch is enable by toggle signal of /LFT_WIN, /LB_WIN (or /RB_WIN) according to mode.

* DRAM(CINE MEMORY)

---

#### 3.4.2.3 Flash Memory

- Flash memory is a NAND type and uses a backup memory for image saving.
- It is controlled at Flash memory controller (FPGA 1) generated by CPU Portout.
- Flash memory control is achieved at Flash memory controller (FPGA1) under CPU portout. But as CPU controls by the control signals such as FLM_CLE, FLM_ALE, /FLM_WE, /FLM_RE that are selected through CPU portout, Flash memory controller work as simple interface.

![Diagram for Cine Mode]
3.4.2.5 Scanline Masking Window

- When change the Mode (BM\(\rightarrow\)B or BB\(\rightarrow\)B) or control the Gain, an unsuitable image display on the monitor due to save unsuitable data out of image area since VRAM address control unstable

- Display clock is a regular according to probe element.
  It occurs as much as scanline.
Display clock is constant by probe element. That is to say, Display clock generates as much as scanline. Thus, if count a number of scanline and use it for the Master reset of 74HCT27 on the front stage of MGA005, the dummy scanline problem can be solved by pass through only the data under image area. The other data out of image area is reset.

However, due to only the display clock is available that pass through the disable period of /LATCH_CLR, make a new signal of /M_LATCH_CLR and use to /MR in 74HCT273.
3.4.3 CRD, Graybar, Overlay Post Memory Part

3.4.3.1 CRD

- Display the ultrasound image of the Convex probe on the monitor, system recognize and read the data of Frame memory by Display clock that generated on DCG (Display Clock Generator).
- One scanline will be interpolated to the Horizontal Sync (HSYNC) as fixed Scanline number from the system and the frequency of interpolation DCG Clock will be changed whenever the HSYNC is generated according to the Vertical Sync (VSYNC). The image from Far-Field is interpolated as low frequency DCG Clock and there is a possibility of mosaic problem on actual display.
- The CDR Logic uniformly converts the frequency of signal as 12.6 MHz that input to the Monitor by 1D interpolation to horizontal axis for the data that is interpolated from the Frame Memory as Monitor Dot Clock 12.6 MHz.
- MGA003 gives a parameter required for CRD, treat it as Dot Clock. Input clock receive the data using DULA_CLK_50.
- The parameter that need to CRD get from MGA003, and process it by Dot clock. But the received clock gets the data by using DULA_CLK_50 that delays the ULA clock.
3.4.3.2 Graybar

- Graybar generate 4 Bit data come from MGA003.
- The signal related with Graybar is as follows;
  - GRAY_OE : Controlled by MGA003 and manages the output point of Graybar data
  - CRD_O[4-7] : Graybar data and share both MGA005 output bus and upper 4bit.
  - /BMODE_EN : It is a Enable signal to control data output of MGA005

The basic schema of Graybar is as follows;

3.4.3.3 Overlay

- Overlay data is generated by using overlay memory with controlling overlay GDC by CPU. It goes to FPGA0 and processed to C, G, M, MENU then the final output is overlay data and menu data. The data processing method is described as below block diagram. GMC-D is the data that is processed by overlay GDC in overlay memory and 12.6 MHz of dot_clock is used.
- This data is serially output from FPGA0 and combined with image in post memory.
3.4.3.4 Overlay Control Schema

1 plane consists of 640x480 pixel, and overlay data is mapped by 1bit to 1 pixel.

1 picture=(40 COL x16)x480 Row

GDC manage the external RAM address like above picture, and each picture plane is overlapped like following.

When GDC write to DRAM:
Column:
DRAM_A0 <= OL_AD16
DRAM_A1 <= OL_AD17

Row:
DRAM_A0 <= 0
DRAM_A1 <= 0

When GDC write to DRAM:
Column:
DRAM_A0,1: 0~3 in a GDC_RAS pulse
Row:
DRAM_A0 <= 0
DRAM_A1 <= 0
3.4.3.5 Post Memory

- Post memory consists of SRAM. It combines an image data and an overlay data into the data displayed on the screen.
- It could change the display settings such as Gamma setting by control the data in Post memory.

3.4.4 Noninterlace Output Display Path Port

3.4.4.1 Function

- Non-Interlaced B/W Monitor
  (Recommended by Medison. Medison supplies this monitor.)
- VGA Monitor (We does not fixed specify model. You can use any type.)
- NTSC or PAL VHS Monitor (We does not fixed specify model. You can use any type.)
- NTSC or PAL VCR Record (Only Record. Does not support VCR Play Function.)
- B/W Echo Printer
3.4.4.2 VGA

Generally it has same specification as VGA Signal. It consists of R, G, B, HS, VS.

Pin array meets a standard and a detail wiring diagram is as follows;

<table>
<thead>
<tr>
<th>Pin</th>

</table>
2) Each value of R, G, B is amplified 1.5 times at EL4393 OP-AMP and is output.
3) HSYNC, VSYNC output the FPGA signal by Buffering through 74HCT245 without amplification.

3.4.4.3 VHS

1) Video signal converted D/A at TDA8775 (DAC) transfer output signal of VHS Monitor through 6M LOW-PASS-FILTER.
2) SYNC for INTERLACE used Programmable Sync Generator made by 74ACT715. As booting INTERLACE SYNCE, CPU (8085) select the data by downloading according to VIDEO type whether it is NTSC or PAL. Please refer to below information regarding how to control it and the Table for Down Load Data.
3) The Clock used this generator is different from VIDEO type.
   In case of NTSC, it is used 24.5454M. Otherwise in case of PAL, it is used 29.5M.
   They are selected by muxing of PAL_NTSC signal that produced on CPU.
3.4.4.3.1 Control 74ACT715

1) DATA is located in “KERNEL.SRC” SOURCE.

2) SYNC could make by programming register number set in 74ACT715.

3) DOWN LOAD DATA table is as follows.

<table>
<thead>

</tr>
</tbody>
</table>

4) To make a stable initialization, do data Port Out on Register no.0 lately after Register
   Port Out Sequence from 1 to 18.

5) How to control horizontally the position of screen (move it left and right):
   Register 4 controls the HSYNC cycle and register 3 controls the start point of Blank (that
   is the begging point of image display). Change the value both of them as suitable and be
   careful that “No.4 register – No.3 register” is always 500H. It is to maintain the Blank width
   as 640 DOT constantly.

1) How to control vertically the position of screen (move it up and down):
Register 8 controls the VSYNC cycle and register 7 control the start point of Vertical Blank. Change the value both of them as suitable and be careful that "No.8 register – No.7 register" is always 1E0H.
3.4.4.4 Non-Interlaced B/W (NI-B/W)

1) Video signal converted D/A at TDA8775 (DAC) transfer output signal of NI-B/W Monitor through 6M LOW-PASS-FILTER.

2) What is NI-B/W?
   Using the NON-INTERLACE type even though it has one signal line including both SYNC and Signal such as general INTERLACE.
   It combines the strength each one to make less image vibration than VHS or RF Monitor and better contrast than VGA monitor.

3) Monitor is the same as SA5500 monitor. Only change the case for external usage.

4) Concept of SYNC Generation is described above figure.
   VSYNC can detect during “HSYNC 3” term of the monitor for control the image position to the center. That is to say, detect it faster than EVVS.
3.4.5 Interlace NTSC/PAL Display Part

Interlace NTSC/PAL Display part
3.4.5.1 Frame Grabber CPLD & Memory

- Frame grabber continuously upgrades the data of 640X480 to FGM (Frame Grabber Memory) in real mode. When input new frame grab, stop to upgrade and change the mode to CPU access mode, then transfer the FGM data into Flash memory under controlling by CPU.

15) Battery
   (1) Maker : Saehan Industries Inc.
   (2) Model name : SH-202A

16) LED Operation
   (1) When Battery discharge : RED
   (2) When Battery charge : Orange
   (3) When Battery charge finish : Yellow
   (4) Using Adaptor (NO Battery) : No Color

17) Supply or Cutoff the power
   Using Toggle function of Tack S/W (SW1)
4.2 Block Diagram
4.3 Detail Description

- **Lin Sensing**: supervise total current flow into DC/DC Power Board.
  
  - **Battery Charge Control**: The circuit for Battery charge stops to work by using SD-Charger or Vfbchg when Battery is discharged.
  
  - **Charge Current Sensing**: Control the charging current flow into Battery. Maximum charging current is limited to 3A. When charging current flow under 300mA, charger stops to charge because of recognizing as full charge. Charging current Sensing amplify the voltage measured both end of R5 and then generate that voltage level at U-Com.
  
- **Battery Voltage Sensing**: Check Battery voltage. When insert Battery to the system, recognize the condition whether Battery need to charge or not.
  
  When recognized Battery voltage is under 12V, start to charge until the voltage value reach to 12.6V.
  
  But after reaching 12.6V, it check Charge Current Sensing and then continuously charge Battery until the Charging current reach to about 300mA.

- **Control IC Max 1631**: DC/DV Control IC for output 3.3V, 5V by using BUCK S/W type.
  
  IC works when high voltage input into Pin 23(ON/OFF DC/DC) of IC and starts to switching.
  
  By rectifying each value, it gains output as 3.3V, 5V. The constant voltage such as 3.3V, 5V drive the output voltage and then pass a feedback signal to FB3 (3Pin) and FB5 (12Pin). Also –5V and 6V are proportioned each coil rate and print out by winding.

- **80V,-80V,12V Output**: This value can be gained by Flyback circuit consist of U13(KA3843), Q17, and circumstance control circuit. At this time, the basic voltage is 12V and its value is output as ±87V proportioned to rate of coil. And also ±80V is output through the constant voltage circuit when the output is ±87V.

- **Comparator**: Its reference value is about 2.6V under the standard setting output is ±80V.
  
  If the standard setting output reduce below 60V at any side of ±80V, the reference value could be down. And the down voltage can sensing by U-Com and finally cutoff ±80V by HV_SHDN on it.

- **Color display of LED**
  
  1) Using only Adaptor: No Color.
  2) Under Charging: Orange.
  3) Under Discharging: Red.
  4) Finishing the recharge: Yellow

- **Working description of U-Com**
  
  1) **ON/ OFF (5Pin)**: Input terminal to control a hole Power Board by Toggle S/W
  2) **PWM (6Pin)**: Control the Battery charging current by On/Off Duty
  3) **ON/ OFF FAN (8Pin)**: Fan work by recognizing “H” signal from the output of 14Pin
when a temperature around LM35 increase over the standard temperature.

4) SD_Charger (10Pin) : When the charging circuit dose not work, control LED and shutdown it by moving 1PIN of U3 to Low.

5) BAT_WARNING (11Pin) : Warning display when the Battery Voltage decrease below 9.2±0.2V.

6) HV_SHDN (12Pin) : It could be off when the output voltage of ±80V is wrong.

7) Temp_Sensing (14Pin) : Fan work by recognizing 0.1mV/1°C when a temperature around LM35 increase over the standard temperature.

8) HV_Sensing (15Pin) : Checking the output of ±80V whether its value is good or not.

9) Iin_Sensing (16Pin) : Checking and Limiting the inflow current from outside.

10) BAT_Voltage (17Pin) : Checking and Limiting the charging voltage of Battery

11) Ich_Sense (16Pin) : Checking and Limiting the charging current of Battery

12) Vad_EN : Check IN/OUT of adapter.

- Battery Alarm sound: When the battery voltage drops to 10.2V, Alarm sounds each 10sec to notice about it.

- Battery Cutoff Voltage: When Battery voltage drops to 9.2V, the system cut off it. As the result, the battery voltage increases to about 10V.
5.Probe

5.1. General Description
The probe element is the same as a standard probe of SA600, Sa9900 with 96 elements.
When apply the probe with 128 elements to the system, only use 96 elements among them.
There is 16 channel type and embody 1x6 Mux switch with HV20220 as main device.
Probe box consists of PB_Main board, PB_Odd board and PB_Even board to separate the element as odd or even.

5.2. Detail description
Probe ID connects to the system with Pull up resistance at 3.3V. To make ID bit Low, short between ID bit and Ground. The signal that probe connect with the system is pull up in system inside and the Probe insert signal is set as ground at probe. Thus when /PRB_INS is low, High Voltage also turn 0V into +/- 80 V and it is possible to firing. 5V TTL drive HVSW HV20220 Control signal. The signal is buffering at PB_main board and divides PB_Odd and PB_Even. Some of ultrasound signals, Echo 0,2,4,…,14, connect to PB_Odd, and some of them, Echo 1,3,5,…,15, connect to PB_Even.

5.3 Probe Connector Pin Define
Using ITT Cannon 60 Pin Male Connector its array is 6x10 matrix.
The bottom of left under take a view of Female connector connected the system is 1A pin.
The define of each pin is as bellows;

5.6.3 PB_EVEN Top/Bottom Size
6. ASIC Data Sheet

6.1 MAGA0010A Manual: Frame Memory Controller

6.1.1 Description

MGA001A is ASIC for FMC use only and design to make a various signal under ASIC Technology.

The signal related with Frame memory is Data and Address bus, Control signal such as /RAS, /CAS, /OE, /WE, etc.

Total Frame Average Factor is 6ea since Data Bus in Frame memory connect with Frame Average Logic at chip inside. Mysonon201 use only 4ea among them.
6.1.3 Pin Diagram

MGA001A
6.2 MAGA003A Manual : Clocks Generators

MGA003A: Gate Array designed by ASIC technology
About 7500 gates
208 pin QFP package

6.2.1 Description
MGA 003A is composed of 5 different parts such as Sampling Clock Generator (SCG), Display Clock Generator (DCG), Gray Bar Display (GBG), Constant Rate Display (CRD) control logic, and address decoding logic.

6.2.2 Main Features
- SCG (Sampling Clock Generator): Basically sampling clock is generated from ROM data containing LOOK-UP table which is the clock – map. These data are composed BASE - value, CORRECTION – value, and BLANK – value. The correction data has AD clock pattern (map) and 2048 deferent clocks can be made.
- DCG (Display Clock Generator): Display clock is generated by using the ROM’s data of display clock having this bit pattern. Mysono201 support 8 different display clock for each liner and convex probe.
- GBU (Gray Bar Generator): To make gray bar and overlay shadow by using hardware.
- Address decoding logic: The many kinds of I/O ports used in DSC are decoded in this logic.
- CRD (Constant Rate Display): Supply Read Clock of Frame Memory

Service Manual  Published by Customer Service Department
6.3 MAGA005 Manual

6.3.1 Description

- To display the ultrasound image of the Convex probe on the monitor, system recognize and read the data of Frame memory by Display clock that generated on DCG (Display Clock Generator).
- One scanline will be interpolated to the Horizontal Sync (HSYNC) as fixed Scanline number from the system and the frequency of interpolation DCG Clock will be changed whenever the HSYNC is generated according to the Vertical Sync (VSYNC). The image from Far-Field is interpolated as low frequency DCG Clock and there is a possibility of mosaic problem on actual display.
- The CDR Logic uniformly converts the frequency of signal as 12.6 MHz that input to the Monitor by 1D interpolation to horizontal axis for the data that is interpolated from the Frame Memory as Monitor Dot Clock 12.6 MHz.

### 6.4 MCB014 Manual

#### 6.4.1 Main Features
- 4 Channel RX & 8 channel TX in one chip
- Up to 4 parallel beam receiving in each RX channel
- Full TX function including TX apodization, Coded exitation
- Throughput up to 62 MSPS
- Extended accuracy focusing delay: RX: Up to ±3ns, TX: Up to ±4ns
- Internal small micro-processor for internal initialization data computing
- Reduced initialization data sets for external initialization
- Initialization data loading (or computing) while running
- Powerful board debugging functions
- +3.3V Power Supply

6.5.1 Main Features
- Synthetic Aperture summing and Multi-beam demultiplexing (external RAM needed)
- Digital TGC, SGC (scan-line gain compensation)
- RF Decimation Filter and Decimation
- DC Cancelling Filter
- Mixer with variable frequency NCO (Numerically Controlled Oscillator)
- Dynamic FIR Filter
- Moving Averager
- N/M nearest decimation for I/Q
- Envelope Detector using Square-Root and Square
- Log Compression
- Decimation Filter for B/W and N/M nearest decimation for B/W
- Zone Blend
- Non-linear Black-Hole Filling & Noise Suppression Filter for B/W
- Anti-Aliasing and/or Edge Enhance filter for B/W
- Analog TGC (including analog SGC) data for Beamformer

1. LCD

1.1 General Description

The LG LCD model LP064V1 LCD is a Color Active Matrix Liquid Crystal Display with an integral Cold Cathode Fluorescent Tube (CCFT) back light system. The matrix employs a-Si Thin Film Transistor as the active element.

It is a transmissive type display operating in the normally white mode. This TFT-LCD has a 6.4 inch diagonally measured active display area with VGA resolution (480 vertical by 640 horizontal pixel array). Each pixel is divided into Red, Green and Blue sub-pixels or dots which are arranged in vertical stripes. Gray scale or the brightness of the sub-pixel color is determined with a 6-bit gray scale signal for each dot, thus, presenting a palette of more than 262,144 colors. The LP064V1 LCD is intended to support applications where low power consumption, weight and thickness are critical factors and graphic displays are important.

In combination with the vertical arrangement of the sub-pixels, the LP064V1 characteristics provide an excellent flat panel display for office automation products such as portable computers and NTSC application.
### 1.1.1 General Display Characteristics

The following are general features of the model LP064V1 LCD:

- **Active display area**: 6.4 inches (cm) diagonal
- **Outsize dimensions**: 168W x 123 H x 9.0D mm Typ.
- **Pixel pitch**: 0.204 mm * 0.204 mm
- **640 hor. By 480 ver. Pixels**
- **RGB stripe arrangement**: 6-bit
- **Color depth**: transmissive mode, normally white
- **Display operating mode**: hard coating(2H),
- **Surface treatment**: anti-glare treatment of the front polarizer

### 1.2 Maximum Ratings

The following are maximum values which, if exceeded, may cause faulty operation or damage to the unit.

1.3 Electrical Specifications

The LP064V1 requires two power inputs. One is employed to power the LCD electronics and to derive the voltages to drive the TFT array and liquid crystal. The second input which powers the backlight CCFT, is typically generated by an inverter. The inverter is an external unit to the LCD.
1.4 Optical Specifications

Optical characteristics are determined after the unit has been ‘ON’ and stable for approximately 30 minutes in a dark environment at 25°C. The values specified are at an approximate distance 50cm from the LCD surface at a viewing angle of Φ and θ equal to 0°. Appendix A presents additional information concerning the specified characteristics.

1.5 Interface Connections

This LCD employs two interface connections, a 31 pin connector is used for the module and a three pin connector is used for the integral backlight system. The electric interface connector is a model DF9B-31P-1V, manufactured by Hirose. The mating connector part number is DF9-31S-1V or equivalent. The pin configuration for the connector is shown in the table below.
### Table 3 Module Connector Pin Configuration

1.6 Power Sequence

![Power Sequence Diagram]

- \( t_1 \leq 40 \text{msec} \)
- \( 0 < t_2 \leq 50 \text{msec} \)
- \( 0 < t_3 \leq 50 \text{msec} \)
- \( t_4 < 1 \text{sec} \)
- \( 0 < t_5 \leq 2 \text{ sec} \)
- \( 0 < t_6 \leq 2 \text{sec} \)

* Set 0 Volt \( \Rightarrow \) \( Vi(t) \leq V_{DD}(t) \)

Here \( Vi(t) \), \( V_{DD}(t) \) indicate the transitive state of \( Vi \), \( V_{DD} \) when power supply is turned ON or OFF.

1.7 Mechanical Characteristics

The chart below provides general mechanical characteristics for the model LP064V1 LCD. The surface of the LCD has an anti-glare coating to minimize reflection and a 2H hard coating to reduce scratching. In addition, the figure below is a detailed mechanical drawing of the LCD. Note that dimension is given for reference purposes only.

- **Outside dimensions**
  - Width: 168 mm
  - Height: 123 mm
  - Thickness: 9.0 mm

- **Active Display area**
  - Width: 130.56 mm
  - Height: 97.92 mm
  - Diagonal: 163.2 mm

- **Weight (approximate)**: 230 g Typ.

1.9 Handling Precautions

Please pay attention to the followings when you use this TFT/LCD module with Back-light unit.

1.9.1. Mounting Precaution

1) You must mount Module using mounting holes arranged in 4 corners.
   Be sure to turn off the power when connecting or disconnecting the circuit.
2) Note that the polarizers are easily damaged. Pay attention not to scratch or press this
   surface with any hard object.
3) When the LCD surface become dirty, please wipe it off with a soft material.
   (ie.cottonball)
   Protect the module from the ESD as it may damage the electronic circuit (C-MOS).
   Make certain that treatment person’s body are grounded through wrist bend.
4) Protect the module from the ESD as it may damage the electric circuit (C_MOS).
   Make certain that treatment person’s body are grounded through wrist bend.

5) Do not disassemble the module and be careful not to incur a mechanical shock that might occur during installation. It may cause permanent damage.

6) Do not leave the module in high temperatures, Particularly in areas of high humidity for a long time.

7) The module not be expose to the direct sunlight.

8) Avoid contact with water as it may a short circuit within the module.

1.9.2. Operating Precaution

1) The spike noise causes the mis-operation of circuits.
   Be lower the spike noise as follows:
   \[ VDD=\pm 200mV, \ V1=\pm 200mV (Over \ and \ under \ shoot \ voltage.) \]

2) Response time depends on the temperature. (In lower temperature, it becomes longer.)

3) Brightness depends on the temperature. (In lower temperature, it becomes lower.)
   And in lower temperature, response time (Required time that brightness is stable after turn on) becomes longer.

4) Be careful for condensation at sudden temperature change. Condensation make damage to polarizer or electrical contact part. And after fading condensation, smear or spot will occur.

5) When fixed pattern are displayed at long times, remnant image is likely to occur.

6) Module has high frequency circuit. If you need to shield the electromagnetic noise.
   Please do in yours.

7) When Back-light unit is operating, it sounds.
   If you need to shield the noise, please do in yours.

1.9.3 Electrostatic Discharge Control
Since module is composed with electronic circuit, it is not strong to electrostatic discharge.
Make certain that treatment persons are connected to ground through list band etc.. And don’t touch I/F pin directly.

1.9.4 Precaution For Strong Light Exposure.
Strong light exposure causes degradation of polarizer and color filter.

1.9.5 Storage
When storing module as spares for long time, the following precautions are necessary.

1) Store them in a dark place: do not expose then to sunlight or fluorescent light. Keep the temperature between 5 and 35 at normal humidity.

2) The polarizer surface should not come in contact with any other object. It is recommended that they be stored in the container in which they were shipped.
1.9.6 Handling Precautions For Protection Film

1) When the protection film is peeled off, static electricity is generated between the film and the polarizer. This film should be peeled off slowly and carefully by people who are electrically grounded and with well ion-blown equipment or in such a condition. etc.

2) The protection film is attached the polarizer with a small amount of glue. If some stress is applied to rub the protection film against the polarizer during the time you peel off the film, the glue is apt to remain more on the polarizer. So please carefully peel off the protection film without rubbing it against the polarizer.

3) When the module with protection film attached is stored for long time, sometimes there remains a very small amount of glue still on the polarizer after the protection film is peeled off. Please refrain from storing the module at the high temperature and high humidity for glue is apt to remain in these conditions.

4) The glue may be taken for the modules failure, but you can remove the glue easily. When the glue remains on the polarizer surface or its vestige is recognized, please wipe them off with absorbent cotton waste or other soft material like chamois soaked with Normal-hexane.

1.9.7 Safety

1) If module is broken, be careful to handle not to injure. (TFT/LCD and lamp are made of glass)
   Please wash hands sufficiently when you touch the liquid crystal coming out from broken LCDs.

2) As it is possible for PCB or other electronic parts of module to small to smoke and to take fire because of the short circuit. Please design the circuit of your instrument not to flow the electric current to TFT/LCD module more than 500mA. (by apply the fuse for example)

3) As Back-light unit has high voltage circuit internal, do not open the case and do not insert foreign materials in the case.
A-1 Brightness

<measuring point>

A-2 Response Time

The response time is defined as the following figure and shall be measured by switching the input signal for “black” and “white”.

![Response Time Diagram]
A-3 Viewing angle

<Definition of viewing angle range>
2. Adapter

2.1 SPEC. and Application Range

It is electric power supply of myso201, and the output is DC16V which is supplied by AC power source.

- Model Name: MYSONO201 ADAPTOR
- Inputting voltage and frequency: 50/60Hz ±3Hz AC 90V – 264V
- Inputting current: Max 1.3A
- Outputting voltage and a rated current

notice)
1) For measuring Allowed Ripple Voltage, 100uF electrolytic condenser on end of Probe and 0.1uf Ceramic condenser are closely connects with load.
2) measurement Scope is 100MHz Analog Scope.(50mV/0.5msec)
   - cooling method: natural air cooling
   - safety, electric wave, standard: satisfies IEC60601-1
   - efficiency: the above 75% (inputting 220V, MAX load standard)
   - Environment of operation
     1) the range of temperature: 0°C ~40°C
     2) the range of humidity: 10% ~90%RH (be careful dewdrop)
   - Environment of storage
     1) the range of temperature: -15°C ~70°C
     2) the range of humidity: 10% ~95%RH (be careful dewdrop)
   - the range of OCP 1) 16V: 6A~10A
   - the range of OVP 1) 16V: 18A~21A
   - Setup/Off Time (basis of Max Load)
     1) AC260V: below 2 sec
     2) AC90V: below 6 sec
   - Rising/Falling Time
     1) 16V: below 30μsec
   - Inrush current 1) Max 70A
   - Over/Undershoot 1) below 3% output

Symmetry Blank on aperature shape inside: Check A/D Converter or OP Amp(AD812)
1.3 Battery Diagnosis

- **Battery Only**
  - Press Check Button
    - LED ON
      - OK
    - LED OFF
      - Fix Battery

- **Battery with System**
  - Check Battery LED
    - LED Off: No Battery
    - LED Red: Battery Discharging without Power Adaptor
    - LED Yellow: Battery Charging with Power Adaptor
    - LED Green: Battery Full Charged with Power Adaptor
    - Beep sound sometimes & LED Red
      - Recharge Connect Power Adapter
    - Check System Power
## 1.4 Etcetera Diagnosis

<table>
<thead>
<tr>
<th>Defect symptom</th>
<th>Help index</th>
</tr>
</thead>
</table>
| **System is no booting**                | 1. Does the image appear on the screen?  
(only LCD does not display)  
⇒ Y : check the bad connecting with keyboard and main body.  
2. Does parts get damaged?  
(Overlay GDC, CPU, FPGA, PROM, SYSTEM ROM..etc)  
⇒ Y : Change the parts |
| **The image is not appeared**           | 1. Does DSC board and F/E board connector is normal?  
⇒ N : check the connector connecting  
2. When inputting image pattern in Debug mode, Does pattern appear are normal?  
⇒ Y : hardly output data from F/E board. / |
| **The image is appeared as frosty**     | 1. Does DSC board and F/E board connector is normal?  
⇒ N : check the connector connecting  
2. Does Frame Memory is normal?  
⇒ N : change the FM |
| **The image is appeared as frosty in Cine mode** | Does Cine memory is normal? (or peripheral buffer)  
⇒ Change the Cine memory (0~15, 16~31) |
| **M-mode image is not appeared or broken** | Does Right Frame Memory is normal? (or peripheral latch)  
⇒ N : change the Memory and Latch |
| **Keyboard defectiveness**              | Does some part of Key test is not working?  
⇒ Y : check the bad connecting with Keyboard and Main body and check the Key Rom |
| **Not able to recognize Probe**         | 1. Does Probe is normal?(recognize Probe ID)  
⇒ change the Probe  
2. Do SPC and FE connector or F/E and DSC connector are normal?  
⇒ check the connector connecting  
3. Does F/E CPLD is normal?  
⇒ change the parts |
| **The image not be able to save or li-view does not working** | 1. How much space Does Flash memory have?  
⇒ N : image all delete and initialize  
2. Does flash memory is normal?  
⇒ N : change the Flash memory  
⇒ Y : check the Flash memory controller(FPGA1) |
2. Debug Mode

2.1 Debug Menu

- MemoryChk: Connect the Memory test mode
- KeyTest: Connect the Keyboard test mode
- Biopsy: Connect the Biopsy setting mode
- Monitor: Connect the Monitor display test mode
- PortChk: Connect the CPU I/O port test mode
- ImgTunning: It is Reserved mode. Not in use.
2.2 Image Memory Debugger Menu

1) Read 1 page from SRAM

From Image Grabber SRAM of special address, read the data as the unit of 1 page (512 bytes).

3 bytes write : 1st byte bit7 = 1: cpu access, bit7=0: system access
1st byte bit5..3 not used
1st byte bit2..0 address
2nd, 3rd byte address

ex1) From 800000 – 00000H, read 512 data.
ex2) From 870000 – 70000H, read 512 data.

2) Write 1 page to SRAM

On Image Grabber SRAM of special address, write the data as the unit of 1 page.

4 bytes write : 1st, 2nd, 3rd is same with reading data.
4th data increment

ex1) write the 512 data such as 80000001 – ffh, 00h, 01h, 02h, ....
ex2) write the 512 data such as 80000002 – ffh, 01h, 03h, 05h, ...

3) DUMP RAM

CPU memory (ROM, RAM) area was read as the unit of 128 bytes.
RAM area is by a000h~bfffh.
ROM area is 0000h~ffffh except RAM area.

ex1) From 0000 – 0000h address, read 128 bytes data.
ex2) From a000 – a000h address, read 128 bytes data.

4) CLEAR RAM

After Clear CPU NVRAM, initialize the system.
After initialize, user must perform Erased All Flash certainly.

5) Read 1 page from FLASH

From Flash memory of special area, read data as unit of 1 page.

ccXXYY :

1) cc is chip number, 01=1, chip, 02=2, chip, 04=smart media
2) XXY is block address(0~1023)
3) Y is page address(0~15)

ex1) 010000 – read the 0 page among the first flash memory 0th block.
ex2) 02000a – read the a(10) page among the second flash memory.
ex3) 04000f – read the f(15) page among the smart media 0th block.
ex4) 010014 – read the 4th page among the first flash memory 1th block.
6) Write 1 page to FLASH
   On Flash memory of special area, write data as the unit of 1 page.
   ccXXYYii :
   1) ccXXYY is such as reading.
   2) ii is increment value of writing data.

7) Read 1 page from DRAM
   Read data as the unit of 1 page on special range of Cine DRAM.
   ffXX :
   1) ff means frame number, 0~31
   2) XX means row address, 0~256
   ex) Read row data in 0000 – 0 of frame

8) Write 1 page to DRAM
   Write data as the unit of 1 page on range of special in Cine DRAM.
   ffXXii :
   1) ffXX is such as read
   2) ii is increment value of writing data
   ex) 050002 – 5 frame, 0 row write

9) Initialize FLASH
   Initialize the flash memory. Not in use.

10) Erase all FLASH
    Delete all data in flash memory. But remain the biopsy data.

11) HOST Chip Select
    When choose the 014, 015 chip, HOST Chip Select is used.
    XY :
    X : 0 = first 014, 1 = second 014, 2 = 015
    Y : 0 = internal memory, 1 = external memory
    ex1) 00 – It is for access to first 014 internal memory.
    ex2) 20 – It is for access to 015 internal memory.

12) HOST Address Select
    Choose 014, 015 internal or external memory address.
    ex) 12f4h : choose the 01f4h address

13) HOST Data Write
    This function is to write data of 2 bytes on selected address.
    ex) 1155h – Write 1155h data from Selected chip 12f4h address.

14) HOST Data Read
    This function is to read data of 2 bytes on selected address.
    ex) dd77h – Read data of 2 bytes from selected chip 12f4h address.

15) HOST Data Dump
    This function is to read data of 128 bytes from selected address.
16) HOST Halt mode off

This function is to return to real mode, If this function is not work, press "R" key which is short cut.

2.3 Keyboard Menu

It is Keyboard test mode. When press the special key, appear and flick the letter on pressed key.
And In upper left, appear the scan code value applicable to the key. If user want to go out this mode, press the "y" button, next press the enter button.
2.4 BIOPSY Menu

“Addition sight which has the line”

It is Biopsy setting menu. Biopsy supply 3 type and every one biopsy take 3 biopsy line on the screen. Middle-line is throughway of biopsy needle and both side-line indicate a range of allowable error on throughway of needle. Biopsy line information is saved in flash memory. Flash memory does not delete absolutely, unless user delete on purpose. Although some flash memory was broken, biopsy line is working normal because save the same information at three place on the flash memory.

When draw up a Biopsy line, it have to be applied to each 4 depth. When operate the direction and inverter function, user must check that whether needle follow biopsy line or not. When Choose the Setup button, appear sub-menu, Press the biopsy button in the sub-menu. There is Biopsy line on/off function in the biopsy menu. That function button is toggle key. If biopsy line is on, it is not deleted absolutely without mode change condition.

2.5 MONITOR Menu

“Addition 3 display mode”

Cross Hat  Display overlay data as a checkered on the screen.
Circle    Display overlay data as a circle on the screen.
Full H    Display fill up the “H” letter on the screen.
2.6 8085 I/O DEBUGGER Menu

1) LOOPING READ I/O PORT
   - Repeat reading the data on special CPU I/O.

2) LOOPING WRITE I/O PORT
   - Repeat writing the data on special CPU I/O.

3) LOOPING WRITE/READ I/O PORT
   - Repeat reading and writing the data on special CPU I/O.

4) READ I/O PORT ONCE
   - Read data on special CPU I/O port, only one time.

5) WRITE I/O PORT ONCE
   - Read data on special CPU I/O port, only one time.

6) READ RAM MEMORY
   - Not in use.

7) WRITE TO RAM MEMORY
   - Not in use.

8) OVL ++, X. OVL –
   - Not in use.

9) READ RAM MEMORY
   - Not in use.

10) SCANLINE FIX
    - Print one scanline after fixed to change All scanline as one scanline.

11) SCANLINE NORMAL
    - It is made normal scanline printed condition.

12) SET PARM2.
    - Fix the writing value on the frame memory.

13) FM/WR COL ADDR
    - Fix the column address on the frame memory.

14) FM/WR ROW ADDR.
    - Fix the row address on the frame memory.

15) WRITE F/M STEP
    - Not in use.

16) FILL F/M BANK0
    - Fixed parameter value fill up on the Frame memory.
1. Spare Parts Assembling Diagram

1.1 TFT LCD Monitor Replacement Method

1) Remove battery. (option)

2) To remove 6 screw on the cover body bottom, use “+” screwdriver.
3) To remove 6 screw on the COVER BOTTOM ARM, use “+” screwdriver.
4) To remove 6 screw on the LCD monitor cover, use “+” screwdriver.

5) Remove 4 screw on the LCD monitor.
6) Disconnect with CN1(12pin) on the LCD INVERT board and CON1(31 pin) on the LCD main board.
7) Replace the LCD Display.
1.2 Key Matrix PCB Replacement Method

1) Remove battery on the cover body bottom.
2) Remove 6 screw on the cover body bottom.
3) When remove 2 screw on the cover body front, upper body cover is disconnected.
4) Disconnect Trackball & KEY MATRIX PCB J2 (8-pin flex circuit).
5) Disconnect J5, J6 on the KEY MATRIX.
6) To remove 21 screw, use "+" screwdriver.
7) Key Matrix PCB Replacement.
1.3 Trackball Replacement Method
1) Remove battery.
2) When remove 6 screw on the cover body bottom, upper body cover is disconnected.
3) When remove 2 screw on the cover body front, upper body cover is disconnected.
4) Disconnect J5, J6 on the KEY MATRIX PCB.
5) Remove 21 screw, use “+” screwdriver.
6) Disconnect Trackball & KEY MATRIX PCB J2 (8-pin flex circuit).

7) Trackball Replacement
1.4 PCB Boards Replacement

1.4.1 DSC Board Replacement Method

Figure 1.5 Removing the Video-output B/D from DSC B/D
1) Remove battery.
2) When remove 2 screw on the cover body bottom, upper body cover is disconnected.
3) When remove 2 screw on the cover body front, upper body cover is disconnected.
4) Remove 11 screw on the DSC BOARD and Disconnect Video-output B/D.

5) Remove Knob.
6) Disconnect J14 (9-pin) connector.

1.4.2 Front End Board Replacement Method

Figure 1.5.1 Removing the Video-output B/D from DSC B/D

Figure 1.5.2 Removing the Adapter B/D from the Frend End B/D
1) For disconnecting, ADAPTER B/D, to remove 6 screw by “+” screwdriver.
2) For disconnecting, user pulled ADAPTER B/D.

3) Remove 8 PCB support on the F/E board.
4) Disconnect the connector which coupled with J4(50-pin) on F/E board and Power board.
5) Disconnect cover-shield-f/e.
6) Replace F/E B/D.
1.4.3 Power Board Replacement Method

1) Remove J3 (2-pin) on the POWER board.
2) Remove 7 PCB support.
3) After remove 13 screw, disconnect cover-shield-power.
4) Replace Power board.

1. Specification

### 1.1 Technical Specification

| Physical Dimensions | Width: 255 mm  
|                     | Height: 300 mm  
|                     | Depth: 90 mm  
|                     | Weight: less than 4.0kg |
| Imaging modes       | 2D real-time  
|                     | Dual 2D real-time  
|                     | 2D/M-mode  
|                     | M-Mode |
| Gray Scale          | Internal 64 levels, External 256 levels |
| Channels            | 16 transmit channels |
| Focusing            | Dynamic transmit focusing, maximum of four points  
|                     | (one point selectable)  
|                     | Digital dynamic receive focusing (continuous) |
| Probes              | **Curved Linear Array**  
|                     | C2-5/60BD(CLA3.5MHz/60R/60D)  
|                     | C4-7BD(CLA5.0MHz/40R/60D)  
|                     | EC4-9/13CD(CLA6.5MHz/13R/120D)  
|                     | **Linear Array**  
|                     | L4-7CD(LA5.0MHz/65mm)  
|                     | L5-9CD(LA7.5MHz/40mm)  
|                     | L5-9/60CD(LA7.5MHz/60mm)  
| Reserved Probes     | C4-9 / 10ED (Reserved)  
|                     | C5-8BD (Reserved)  
|                     | VE5-8ED (Reserved)  
|                     | L2-5 / 120CD (Reserved)  
|                     | L2-5 / 150CD (Reserved)  
|                     | L2-5 / 170CD (Reserved)  
|                     | LV4-7AD (Reserved)  
|                     | LV5-9AD (Reserved)  
| Probe connection    | 1 probe connector |
| Monitor             | 6.4 inch LCD monitor |
| Peripherals         | B/W Printer  
|                     | VCR |
| **Image Storage** | Cine memory (maximum 32 frames)  
Image Storage (maximum 50 frames) |
<table>
<thead>
<tr>
<th></th>
<th></th>

</thead>
<tbody>
<tr>
<td><strong>Application</strong></td>
<td>Fetal, Abdominal, Pediatric, Small organ, Intra-vascular, Peripheral-vascular, Muscular-skeletal, Cardiac, Trans-rectal, Trans-vaginal</td>
</tr>
</tbody>
</table>
| **Calculation and Quantification** | Measurement of various parameters  
Obstetrical analysis:  
Standard gestational age tables: BPD, HC, FL, AC, AD, CRL, GS.  
6 equations for fetal weight (Osaka University, Merz, Shepard, Hadlock, Tokyo University 1, and Tokyo University 2 method)  
User-created tables  
Cardiac analysis:  
LV, AV, and MV,  
Heart rate |
| **Signal processing (Pre-processing)** | Near, Far, Overall Gain control  
Dynamic aperture  
Dynamic apodization  
Dynamic range control (adjustable)  
M-mode sweep speed control  
Frame average Gamma-scale windowing  
Image orientation (left/right and up/down)  
White on black |
| **Measurement** | Touch pad control of multiple calipers  
B-mode: Distance, circumference, area, ellipse, volume.  
M-mode: Velocity, time, slope |

## 1.2 Safety Standard

- **Classification:**
  - Class I equipment with Type BF applied parts
  - Ordinary Equipment
  - Non-AP/APG

- **Electromechanical safety standards met:**
  - CSA C22.2 No.601.1, Canadian Standards Association, Medical Electrical Equipment
  - EN60601-1, Second Edition, including Amendments 1 and 2, European Norm, Medical Electrical Equipment

IEC61157: 1992, International Electrotechnical Commission, Requirements for the declaration of the acoustic output of medical diagnostic ultrasonic equipment

UL 2601-1, Underwriters Laboratories, Medical Electrical Equipment
1.3 Range of measurement and accuracy

1.3.1 B mode range and accuracy

<table>
<thead>
<tr>
<th>Measurement Type</th>
<th>Range</th>
<th>Accuracy (Whichever is greater)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axial Distance</td>
<td>1 - 250 mm</td>
<td>+/- 2% or +/- 2 mm</td>
</tr>
<tr>
<td>Lateral Distance</td>
<td>1 - 250 mm</td>
<td>+/- 2% or +/- 2 mm</td>
</tr>
<tr>
<td>Diagonal Distance</td>
<td>1 - 250 mm</td>
<td>+/- 2% or +/- 2 mm</td>
</tr>
<tr>
<td>Area</td>
<td>1 - 10,000 mm²</td>
<td>+/- 4% or 25mm²</td>
</tr>
<tr>
<td>Circumstance</td>
<td>3 - 1,000 mm</td>
<td>+/- 3% or +/- 5 mm</td>
</tr>
</tbody>
</table>

Note:
The accuracy's are using following equations:
Distance error (2% or 2mm) = Image Pixel error (1% or 1mm) + Hardware error (1% or 1mm)
Area error (4%) = Distance 1 x Distance 2
Circumference error (3% or 5mm) = Distance error (2% or 2mm) + Calculation precision (1% or 3mm)

Measurement accuracy is constrained by the cursor placement capability limit in addition to the specifications in the above table.

1.3.2 M mode range and accuracy

<table>
<thead>
<tr>
<th>Measurement Type</th>
<th>Range</th>
<th>Accuracy (Whichever is greater)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depth</td>
<td>1 - 250 mm</td>
<td>+/- 2% or +/- 2 mm</td>
</tr>
<tr>
<td>Time</td>
<td>0.1 - 10.2 sec</td>
<td>+/- 2% or 0.2 sec</td>
</tr>
<tr>
<td>Slope</td>
<td>1 - 10,000 mm/sec</td>
<td>+/- 4%</td>
</tr>
</tbody>
</table>

Note:
The accuracy's are using following equations:
Distance error (2% or 2mm) = Image Pixel error (1% or 1mm) + Hardware error (1% or 1mm)
Time error (2% or 0.2 sec) = Image Pixel error (1% or 0.1 sec) + Hardware error (1% or 0.1 sec)
Velocity error (4%) = Distance / Time

Measurement accuracy is constrained by the cursor placement capability limit in addition to the specifications in the above table.
