Introduction

For decades, Weinmann has developed, manufactured and distributed equipment for emergency medicine, oxygen therapy, and inhalation therapy.

In 1972, Weinmann introduced the first MEDUMAT emergency ventilator to the market.

MEDUMAT emergency ventilators are automatic resuscitators. They are used for controlled respiration in emergency medicine, e.g. in the event of acute ventilatory disorders, and for secondary obstructions.

The new generation of equipment, which was especially developed to meet the requirements of users and launched on the market in 1997, offers users and patients an enhanced level of safety. An intelligent alarm system monitors the patient’s breathing and notifies the user of any malfunctions.

Hence, this technology offers even greater safety and reliability during respiration.

The aim of these service and repair instructions is to familiarise you, as a knowledgeable expert, with the MEDUMAT in terms of function, technology and repairs. In conjunction with the training you have already received from Weinmann, you are now a trained, qualified expert and are able to instruct your clients correctly, rectify faults yourself, and perform the functional checks described in the instructions for use, as well as conduct any repairs which may be necessary, as outlined in these service and repair instructions.

In the event of a guarantee claim, MEDUMAT should be returned to Weinmann.

To enable us to process any guarantee or goodwill claims, please return the consumer’s proof of purchase (invoice) together with the device.

Repairs and maintenance work must be carried out only by Weinmann or by knowledgeable experts.

You are responsible for all repairs performed by yourself and the warranty thereof!

Only original Weinmann spare parts should be used for repair purposes.

Please remember:
Your customer trusts you and relies on your expertise, just as you rely on Weinmann.

Note:

The following information can be found in the description and operating instructions for MEDUMAT Standard a:

- Safety instructions:
  See chapter 2.
- Mounting with the wall bracket STATION MEDUMAT,
  Mounting of accessories:
  See chapter 3.
- Operation of the MEDUMAT emergency ventilator:
  See chapter 4.
- Hygienic preparation:
  See chapter 5.
- Functional check:
  See chapter 6.

2. Description of ventilator

2.1 Uses

MEDUMAT Standard a is an automatic (short-term) ventilator.

You can use MEDUMAT Standard a:
- to revive patients at the site of an emergency
- on a longer term basis in more protracted emergencies, e.g. fires.

You can use MEDUMAT Standard a whilst transporting patients:
- between the various rooms and departments of a hospital;
- between the hospital and other premises;
- in emergencies;
- when transport over a considerable distance is planned.

MEDUMAT Standard a:
- is used for controlled ventilation of persons with a body weight of about 10 kg upward, or for assisted ventilation from about 1.5 kg body weight;
- is used to treat respiratory arrest;
- can be preset to parameters that ensure evenly balanced ventilation provided that the selected maximum ventilation pressure $P_{\text{max}}$ is not exceeded;
- can be supplied with additional modules for aspiration and oxygen inhalation. (N.B. MEDUMAT Standard a cannot be used as a ventilator simultaneously with these modules)

2.2 Ventilation function

MEDUMAT Standard a operates within a pressure range of 2.7 to 6 bar and at a flow rate of not less than 70 l/min $O_2$. It has a built-in power pack.

The gas used for ventilation is highly compressed medical oxygen, which is reduced to the required operating pressure by a two-stage external pressure reducer. The oxygen supply is fed in at input valve 11.

The continuously variable ventilation frequency and the inspiration/expiration ratio of 1:1.67 for controlled ventilation are controlled by electronic control routines within the device.

Regardless of the ventilation mode selected, the patient is free to use the patient valve to take a spontaneous breath between ventilation cycles. In that case the patient draws the air for breathing from the surroundings.

The gas for inspiration flows along the hose and through the patient valve and either the mask or the tracheal tube into the patient's airways. The patient valve is fitted with a lip membrane that enables expired gas to be conducted away through the expiration tube.
At the normal Air Mix setting, atmospheric air is admixed to give an O₂ concentration of between 5.5% and 8.5% at 10 mbar ventilation pressure (see “9.2 O₂ content when using Air Mix” on page 52).

In certain indications and in cases where the surrounding atmosphere is contaminated, you can switch to No Air Mix and ventilate with pure oxygen.

The injector unit is switched off when switching from Air Mix to No Air Mix. This increases minute volume which can result in the set pressure limit being exceeded and a stenosis alarm [Stenosis] being triggered. In this case, set minute volume correspondingly lower.

In the opposite instance, in other words when switching from No Air Mix to Air Mix, the injector unit is switched on. This reduces minute volume which can lead to the set pressure limit being undershot. In this case, set minute volume correspondingly higher.

2.3 Controlled ventilation

After switching on, MEDUMAT Standard a is automatically in the controlled ventilation mode. This means that the intubated patient receives mandatory ventilation cycles which depend on the ventilation values set on the device.

Mandatory ventilation cycle: it is not the patient, but the device which determines the time of the next breath.

2.4 Assisted ventilation

In addition to the controlled ventilation mode the MEDUMAT Standard a provides an assisted ventilation mode.

Once you switch on the assisted ventilation mode by pressing the Assist button, a green LED flashes to indicate that this mode is operating.

Triggered ventilation cycle: the patient can trigger a ventilation cycle by making an effort to breathe.
Within a time window of 40 % of expiration, the patient can now start a triggered ventilation cycle. To do this the patient must create a flow of at least 5 l/min by making their own efforts to breathe.

If the patient's efforts to breathe are not sufficient to trigger a cycle, the patient automatically receives a mandatory ventilation cycle at the end of the time window, thereby ensuring compliance with the set minute ventilation.

This function allows the device ventilation cycles to be synchronised with the patient's own efforts to breathe.

Between mandatory ventilation cycles the patient has the opportunity to breathe ambient air via the patient valve.

If the patient does not trigger the device, an alarm is set off. The patient then receives controlled ventilation.

IPPV: Intermittent Positive Pressure Ventilation (= controlled ventilation).

2.5 Checking course of ventilation

You can check the course of the ventilation on pressure gauge 1.

2.6 Patient valve

The gas for inspiration is channelled into the patient's airways through the patient valve.

The patient valve is designed so that even in the event of failure of the MEDUMAT Standard a, spontaneous breathing is possible regardless of which ventilation mode you selected.
3. Final Check

After any repair and maintenance work, the device must be subjected to the following final check in accordance with the Test Instructions WMM 22805 and Test Record.

Note:
For a final check on the MEDUMAT Standard a you must connect the respiration tube and the patient valve.

If the final check reveals any faults or deviations from the specified values, you must not use the MEDUMAT Standard a.

We recommend you to keep the following parts in stock:
- Replacement seals for device connections;
- Replacement dust filter;
- Diaphragm for patient valve;
- Diaphragm for spontaneous breathing arm;
- Diaphragm for expiration arm;
- O-ring 1145/118.

3.1 Test resources required

- Oxygen concentration measuring device, Type Oxycontrol WMM 13550
- Volumetric flowmeter, Type RT 200 (Timer) or Type EKU VIP – Ventilator
- Functional check test set WMM 15382
- Adjustable orifice, e.g. ball valve, internal diameter ≥ 10 mm
- Set: hose with injector WMM 15359
- Pressure gauge 0 - 6.3 bar, class 1.6
- Pressure gauge 0 - 100 mbar, class 1.6
- Set, supply test Medumat / Modules WMM 15440

3.2 Preparations for final check

1. Connect MEDUMAT Standard a to test equipment.
2. Set MEDUMAT Standard a with switch in position No Air Mix to Freq. = 40 min⁻¹, MV = 5 l/min and Pmax = 60 mbar.

3.3 Entering device data

- Enter the device type, device number and date of manufacture in the Test Record.
3.4 Testing for leaks and checking pressure reading

3.4.1 Testing for leaks on the inlet side

- With device switched off, apply pressure of 6 bar to inlet side and shut off outlet pressure.
- Set lever to No Air Mix.
  \textbf{Requirement}: The pressure drop must be less than 0.2 bar/min.
- Set lever to Air Mix.
  \textbf{Requirement}: The pressure drop must be less than 0.2 bar/min.

3.4.2 Testing for leaks in pressure measurement segment

- Apply pressure of 60 mbar to pressure measurement segment of Medumat.
- During the measurement, a traction force of approx. 3 N must be applied manually to the elbow outlet.
  \textbf{Requirement}: The pressure drop must be less than 2 mbar/min.

3.4.3 Checking pressure reading

1. Attach T-connector with injector [WM 15359] to pressure measurement connection 14.
2. Connect test pressure gauge 0 - 100 mbar or Timeter to free end of T-connector (pressure gauge/volumetric flowmeter not supplied with device).
3. Use injector to create a pressure of 55 mbar as shown on the test pressure gauge.
  \textbf{Requirement}: Respiration pressure reading must not deviate from set value by more than \leq 1.5 mbar.

3.5 Device self-test after switching on

1. Apply approx. 4.5 bar to the inlet.
2. Switch on MEDUMAT Standard a
  \textbf{Requirement}: The self-test is activated: all 6 LEDs light up together and a brief signal tone sounds.
3.6 Functional check on alarms

3.6.1 Stenosis alarm check up to appliance no. 1799

- Set MEDUMAT Standard a to the Air Mix setting at \( f = 40 \text{ min} \), \( MV = 3 \text{ l/min} \) and \( p_{max} = 60 \text{ mbar} \). Close patient valve outlet.
  
  **Note:** Overresponse of needle is normal.
  
  **Requirement:** The stenosis alarm must be activated after two respiration cycles.

- Set MEDUMAT Standard a to the No Air Mix setting at \( f = 40 \text{ min} \), \( MV = 3 \text{ l/min} \) and \( p_{max} = 60 \text{ mbar} \). Close patient valve outlet.
  
  **Note:** Overresponse of needle is normal.
  
  **Requirement:** The stenosis alarm must be activated after two respiration cycles.

3.6.2 Stenosis alarm check from appliance no. 1800

- Set MEDUMAT Standard a to the Air Mix setting at \( f = 40 \text{ min} \), \( MV = 3 \text{ l/min} \) and \( p_{max} = 60 \text{ mbar} \). Close patient valve outlet.
  
  **Note:** Overresponse of needle is normal.
  
  MEDUMAT Standard a briefly switches to expiration if the maximum ventilation pressure is exceeded, but then tries to continue inspiration in the same inspiration phase.

  If the maximum ventilation pressure is exceeded for a second time during the same inspiration phase, the unit finally switches to expiration and vents the patient tube system completely. The next inspiration begins with the following ventilation stroke according to the frequency selected.

  **Requirement:** The stenosis alarm must be activated after two respiration cycles.

- Set MEDUMAT Standard a to the No Air Mix setting at \( f = 40 \text{ min} \), \( MV = 3 \text{ l/min} \) and \( p_{max} = 60 \text{ mbar} \). Close patient valve outlet.
  
  **Note:** Overresponse of needle is normal.
  
  **Requirement:** The stenosis alarm must be activated after two respiration cycles.

3.6.3 Alarm acknowledgement check

- Immediately after first alarm tone sounds, press button 3 (alarm acknowledgement).
  
  **Requirement:** The alarm tone must be suppressed immediately.

3.6.4 Disconnection alarm check

- Open patient valve outlet.
  
  **Requirement:** The disconnection alarm must be activated after two respiration cycles.

3.6.5 Pressure alarm check

- Shut off pressurised gas connection of Medumat (2.7 - 6.0 bar).
  
  **Requirement:** The pressure alarm must be activated.
3.7 Checking assisted ventilation

Connect ventilation tube with patient valve to test bag.
1. Set MEDUMAT Standard a to MV 8 l/min, Air Mix, f = 8 l/min and P_{max} = 60 mbar.
2. Switch on Assist button 6, green LED in button flashes.
3. Wait for two inspiration phases.
   Requirement: The visual alarm No Assist is actuated (flashing yellow light in alarm field 2).
   The acoustic alarm does not cut in until one minute has elapsed.
4. Simulate inspiration impulses (negative pressure) by squeezing the test bag several times before the next inspiration.
   During simulation the pointer must swing into the negative sector and reach at least -0.8 mbar.
   Requirement: The yellow No Assist LED must go out on inspiration.

3.8 Functional check on frequency setting

Connect respiration tube to 10 mbar orifice and to volumetric flowmeter, then set MEDUMAT Standard a to MV = 11 l/min
1. Run MEDUMAT Standard a in position No Air Mix, Freq. = 5 min^-1.
   Requirement: The measured frequency must be 5 ± 1 min^-1.
2. Run MEDUMAT Standard a in position No Air Mix, Freq. = 15 min^-1.
   Requirement: The measured frequency must be 15 ± 2 min^-1.
3. Run MEDUMAT Standard a in position No Air Mix, Freq. = 25 min^-1.
   Requirement: The measured frequency must be 25 ± 2 min^-1.
4. Run MEDUMAT Standard a in position No Air Mix, Freq. = 40 min^-1.
   Requirement: The measured frequency must be 40 ± 2 min.
3.9 Functional check on tidal volume at 4.5 bar delivery pressure and 10 mbar counterpressure

1. Run MEDUMAT Standard a in position **No Air Mix**, Freq. = 1.5 min⁻¹ and MV = 20 l/min.
   **Requirement:** Tidal volume must be 1300 ± 200 ml.
   Switch MEDUMAT Standard a to position **Air Mix**.
   **Requirement:** Tidal volume must be 1300 ± 200 ml.

2. Run MEDUMAT Standard a in position **No Air Mix**, Freq. = 1.5 min⁻¹ and MV = 11 l/min.
   **Requirement:** Tidal volume must be 730 ± 110 ml.
   Switch MEDUMAT Standard a to position **Air Mix**.
   **Requirement:** Tidal volume must be 730 ± 110 ml.

3. Run MEDUMAT Standard a in position **No Air Mix**, Freq. = 40 min⁻¹ and MV = 5 l/min.
   **Requirement:** Tidal volume must be 125 ± 25 ml.
   Switch MEDUMAT Standard a to position **Air Mix**.
   **Requirement:** Tidal volume must be 125 ± 25 ml.
3.10 Checking oxygen concentration

1. Run MEDUMAT Standard a in position Freq. = 10 min⁻¹ and MV = 11 l/min with 100 % O₂.
2. Check O₂ concentration in position No Air Mix.
   Requirement: The O₂ concentration must be greater than 98 %.
3. Check O₂ concentration in position Air Mix.
   Requirement: The O₂ concentration must lie between 50 % and 65 %.

3.11 Functional check on pressure limit

1. Connect respiration tube to test bag.
2. Set MEDUMAT Standard a to No Air Mix, Freq. = 8 min⁻¹ and MV = 9 l/min.
3. Set pressure limit to 20 mbar.
   Requirement: The pressure limit must respond at 20 ± 5 mbar and trigger the stenosis alarm.
4. Set pressure limit to 60 mbar.
   Requirement: The pressure limit must respond at 60 ± 5 mbar and trigger the stenosis alarm.

3.12 Functional check on exhaust valve without patient valve

1. Run MEDUMAT Standard a in position f = 8 min⁻¹ and MV = 7 l/min.
2. Connect patient valve to device outlet with expiration outlet closed, without lip diaphragm and with test bag.
   Requirement: The test bag is completely inflated in one inspiration stroke. The respiration device can then be heard to exhaust.
3.13 Checking equipment and accessories (system components)

- Respiration tube with patient valve undamaged and in working order
- Functional check test set in working order
- Pressure reducer in working order
- O₂ cylinder within test deadline; valve in working order
- Support plate complete and in working order
- Medical products book present
- Operating instructions present

3.14 Checking external condition

- Check external condition of device.
  requirement: No mechanical damage to housing.
  Device labels with operating information are legible.
  Sealing sleeves are properly seated.
  Pressure gauge zero reading is correct.
  Connecting thread G3/8 is undamaged and functions smoothly.
  All rotary knobs are self-locking against inadvertent readjustment.

3.15 Documentation

- Document points 4 to 14 in the Test Record, along with test date and tester number.
4. Servicing

N.B.
Always remember to carry out a technical safety check of the ventilator after every repair.

MEDUMAT Standard a must be serviced regularly.

We recommend having all maintenance work, servicing and repairs carried out either by the manufacturer Weinmann or by a qualified agent expressly authorised by that company.

4.1 Intervals and Scope

Every 2 years:

Every 2 years, you must subject the device (including patient valve and tube system) to a technical safety check in accordance with §6 of the Regulations for Users.

The servicing and inspection may also be carried out by the manufacturer Weinmann.

The following points should be observed:

- Check that the equipment is complete.
- Visual check for:
  - physical or mechanical damage
  - correct markings on controls
  - damage to all external hoses;
- Replacement of worn components/compulsory change parts (see “7.2 Maintenance set” on page 46);
- Check of system components: transport platforms, oxygen supply fittings, secretion suction system, hose connections etc.
- Check test bag.
- Repeat testing of aluminium oxygen bottles WM 1821 and WM 3621 by the Technical Testing Association. The specified testing date is stamped on the shoulder of the bottle;
- Final check in accordance with Test Instructions/Test Report STK WM 22805 (see “3. Final Check” on page 9 and see “11. Repair and inspection log” on page 53.

Every 4 years:

- Servicing of the fittings in the oxygen supply system (e.g. pressure reducer) either by the manufacturer or by a qualified agent expressly authorised by him.

Every 10 years:

- Repeat testing of the conventional steel or aluminium oxygen bottles by the Technical Testing Association. The specified testing date is stamped on the shoulder of the bottle.
4.2 Batteries and fuses

MEDUMAT Standard a is fitted with two batteries which must always be changed together:

A button cell CR2430 18 supplies the electronics with auxiliary power if the capacity of the main battery 20 is exhausted. This means that an alarm can still be activated in the event of sudden failure of the main battery. The device switches to expiration.

As a general rule, the capacities of the batteries are designed in such a way that under normal usage conditions, they do not need to be changed during the 2-year servicing intervals. Within the context of the prescribed 2-year servicing, the batteries are replaced completely.

We recommend that the batteries be changed only by the manufacturer Weinmann or by authorised specialists explicitly authorised by them, since special precautions must be taken to protect the electronics (see "6.6 Changing the batteries" on page 24).

4.3 Adjusting the pressure gauge

In the idle state, with MEDUMAT Standard a deactivated and the oxygen cylinder closed, the needle of the pressure gauge must point precisely to "0".

To adjust the needle, proceed as follows:

1. Carefully lever out the plastic cover of the adjusting screw.
2. Adjust the needle with the adjusting screw using a small screwdriver (e.g. watchmaker's screwdriver).
3. Re-insert the plastic cover.

4.4 Storage

If you are not intending to use MEDUMAT Standard a for a long period, we recommend the following storage precautions:

1. Clean and disinfect the ventilator (see "5. Hygienic preparation" of the description and operating instructions for MEDUMAT).
2. Store MEDUMAT Standard a in a dry place.

Important note!
Remember that the ventilator still requires servicing at the stipulated intervals even when in storage; otherwise it cannot be used when removed from storage.
4.5 Disposal

Do not dispose of the unit with domestic waste. For proper waste disposal of the equipment, please contact an approved and certified waste disposal site for electronic goods. Ask your Environmental Officer or town council for the address.

6. Repair information and repair instructions

6.1 General

Repairs to MEDUMAT Standard a should be carried out only at an ESD workstation!

- Please follow the safety instructions for MEDUMAT Standard a on page 9 of the description and operating instructions.
- All handling of the device presupposes a precise knowledge of and compliance with the description and operating instructions and the service and repair instructions.
- Please carry out only the repairs described in these service and repair instructions. Otherwise, perfect functioning of the MEDUMAT Standard a cannot be guaranteed.
- Please ensure that your hands and workplace are clean when carrying out repairs.
- After each repair, please perform a functional check (see "3. Final Check" on page 9).
- When you replace components or individual parts, please use original Weinmann parts only.
- When ordering the housing base section 30 please specify the device model, year of construction and device number.
- Note:
  The item numbers used in the following text match the item numbers in the spare parts list on page 44 and the overview on page 4.

6.2 Replacing the sieve in the compressed gas connection

Tools required:
- Slotted screwdriver,
- Tweezers.

1. Unscrew the slotted screw at the compressed gas connection 11.
2. Using the tweezers, remove the sieve set 64.
3. Carefully insert a new sieve set 64 into the compressed gas connection
4. Screw the slotted screw back into the compressed gas connection
6.3 Changing the foam insert in the pressure relief valve outlet

Tools required:
- Tweezers.

1. Use tweezers to remove foam insert 15.
2. Place a new foam insert 15 in the outlet.

6.4 Opening the device

Tools required:
- Cross tip screwdriver, size 2.

1. Carefully place the device on a non-slip surface and unscrew the 6 screw 42 from the rear panel of the device.
2. Pull off the housing base section 30 and fold it away.

3. Next, loosen the connecting tube 48 from the oxygen inlet by pushed back the sleeve on the angular bush 31 and pulling out the tube.
6.5 Closing the device

Tools required:
• Cross-tip screwdriver, size 2.

1. Push the connecting hose 48 into the angular bush 31 as far as it will go.
2. Place the housing base section 30 onto the upper housing section.
   Make sure that none of the lines are pinched, and that the twist lock 12, the grommet 41 and the angled outlet with pressure measurement connection 14 are correctly seated.
3. Next, secure the housing base section using the 6 screws 42.
4. Perform a functional check (see “3. Final Check” on page 9).

6.6 Changing the batteries

Tools required:
• Cross-tip screwdriver, size 2.

1. Open the device (see “6.4 Opening the device” on page 23).
2. The main battery 20 can be removed by lifting the battery out of its holder and then pulling connector X1 from the circuit board.
3. To remove the button cell 18, gently lift up the plus contact and pull the button cell out sideways with your other hand.
4. Insert the new batteries by proceeding in the reverse order.
   Make sure that the wires for the main battery are not pinched and that the button cell is inserted with correct polarity!
5. Close the device (see “6.5 Closing the device” on page 24).
6. Perform a functional check (see “3. Final Check” on page 9).

Remember that used batteries must not be disposed of with your domestic waste. Used batteries should be taken to a collection point in your area, or to a specialist dealer.
6.7 Replacing the fuse

Tools required:
- Cross tip screwdriver, size 2.

1. Open the device (see “6.4 Opening the device” on page 23).
2. Pull out the defective fuse 19 upwards.
3. Carefully press a new fuse 19 into the holder.
4. Close the device (see “6.5 Closing the device” on page 24).
5. Perform a functional check (see “3. Final Check” on page 9).

6.8 Replacing the alarm signalling device

Tools required:
- Cross tip screwdriver, size 2.
- Cross tip screwdriver, size 1.

1. Open the device (see “6.4 Opening the device” on page 23).
2. **Up to appliance no. 1669:**
   - Pull the pressure measurement connection 14 upwards out of the housing wall.
3. Pull the connector X5 from the circuit board.
4. Unscrew both screws 44.
5. Remove the defective alarm signalling device 24.
6. Insert the new alarm signalling device 24.
7. Secure the alarm signalling device using the two screws 44.
8. Push the connector X5 onto the contacts on the circuit board.
9. Close the device (see “6.5 Closing the device” on page 24).
10. Perform a functional check (see “3. Final Check” on page 9).
6.9 Replacing the potentiometer
(for setting pressure or frequency)

Tools required:
- Cross-tip screwdriver, size 2,
- L-handled socket wrench 10 mm,
- Special tool WM 22829 from special tool set WM 15349.
- Calibration device WM 22836

1. Lift off the lid 36.
2. Using the special tool, hold the control knob 37 steady and loosen the nuts with an L-handled socket wrench (10 mm).

   Just loosen – do not remove, otherwise the knob will be dismantled into its component parts.

3. Pull off the control knob 37.
4. Open the device (see “6.4 Opening the device” on page 23).

If you wish to replace the potentiometer 28 for respiratory frequency:

5. Remove the battery 20, by lifting it out of its holder and then pulling connector X1 from the circuit board.

   Pull on the connector only, not on the lead!

6. Pull the connector X3 from the circuit board.
7. Unscrew both the screws 43 and remove the potentiometer 28.
8. Insert a new potentiometer 28 and secure it using the screws 43.
9. Push the connector X3 onto the contacts on the circuit board.
10. Connect the connector X1 of the battery to the circuit board and insert the battery into the holder.

11. Secure the control knob 37:
   - Push the control knob onto the spindle almost to the limit.
   - Hold the knob steady with the special tool and screw it down.
12. Check the display on the control knob: At the left limit, the white line must indicate the lowest value. If this is not the case, loosen the nuts and align the control knob.

13. Perform calibration (see “6.10 Calibration after removal of PCB or Pot 28 (frequency)” on page 28).

14. Close the device (see “6.5 Closing the device” on page 24).

15. Turn the MEDUMAT Standard a round.

16. Place the lid 36 on the control knob 37.

17. Perform a functional check (see “3. Final Check” on page 9).

If you wish to replace potentiometer 29 for respiratory pressure:

5. Pull the connector X4 from the circuit board.

6. Press both tubes 46 towards the circuit board and hold them there.

7. Unscrew both the screws 43 and remove the potentiometer 29.

8. Insert a new potentiometer 29 and secure it using the screws 43.

9. Push the connector X4 onto the contacts on the circuit board.

10. Close the device (see “6.5 Closing the device” on page 24).

11. Turn the MEDUMAT Standard a round.

12. Secure the control knob:
   - Push the control knob onto the spindle almost to the limit.
   - Hold the knob steady using the special tool and screw it on.

13. Check the display on the control knob: At the left limit, the white line must indicate the lowest value. If this is not the case, loosen the nuts and align the control knob.

14. Place the lid 36 on the control knob 37.

15. Perform a functional check (see “3. Final Check” on page 9).
6.10 Calibration after removal of PCB or Pot 28 (frequency)

The control knob 8 controls an EPROM on the printed circuit board of the MEDUMAT Standard a. To ensure correct setting of the minute ventilation, the EPROM must be calibrated after every removal of the PCB or of potentiometer 28.

Tools required:
- Crosstip screwdriver, size 2.
- Calibration device WM 22836.

1. Remove the back of the housing. To do so:
   - Place the device on a non-slip surface and unscrew the 6 screws 42 from the back of the device.
   - Pull off the lower part of the housing 30 and swing it out of the way.

2. Now detach the connecting tube 48 from the oxygen inlet by pushing back the angular bush 31 and pulling out the tube.

3. Switch the calibration device off at the toggle switch. The Status LED is not on.

4. Connect the power cord of the calibration device to connector X6 on the circuit board of the MEDUMAT Standard a.

5. Switch on the MEDUMAT Standard a. You must hear the valve switch.

6. Switch on the calibration device at the toggle switch. The Status LED lights up.

7. Press the bottom button Start/Stop on the calibration device. When it is pressed, all the LEDs on the calibration device light up.

8. As soon as you release the Start/Stop button, communication between the devices is automatically established. While this is happening, the LEDs 10, 30 and Start/Stop flash. Once the Start/Stop LED stay on continuously and LEDs 10 and 30 have gone out, communication is established. The solenoid valve of the MEDUMAT Standard a does not switch any more.
9. Turn the control knob 8 on the MEDUMAT Standard a to the setting frequency=10.

10. Press the top button on the calibration device. The corresponding LED 10 must light up.

11. Turn the control knob 8 on the MEDUMAT Standard a to the setting frequency=30.

12. Press the middle button on the calibration device. The corresponding LED 30 must light up.

13. Press the bottom button Start/Stop on the calibration device. All LEDs except Status go out. You must hear the solenoid valve of the MEDUMAT Standard a switching.

14. Switch off the calibration device at the toggle switch.

15. Disconnect the calibration device from the MEDUMAT Standard a.

16. Close the device (see “6.5 Closing the device” on page 24).

17. Perform a functional check (see “3. Final Check” on page 9).

18. Turn MEDUMAT Standard a off.

6.11 Replacing the circuit board

Tools required:
- Crosstip screwdriver, size 2,
- Side nippers,
- Cable tie,
- Calibration device WM 22836.

1. Open the device (see “6.4 Opening the device” on page 23).

2. Remove the battery 20, by lifting it out of its holder and then pulling connector X1 from the circuit board. 
   Only pull on the connector, not on the lead!

3. Pull connectors X3, X4 and X5 from the circuit board.

4. Release the flat cable from the locking device X7. To do so, pull the upper part of the locking device upwards. You can then pull out the cable.
5. Carefully pull the tube 47 from the sensor B2.

6. Using side nippers, cut through the cable tie 55 at the tube 49.

7. Carefully pull the tube 49 from the sensor B1. If the tube cannot be pulled off, you may cut through it (e.g., using a scalpel). In such cases, the tube must be replaced (as explained in step 10.).

8. Carefully pull the tube 54 from the sensor B3. If the tube cannot be pulled off, you may cut through it (e.g., using a scalpel).

9. Unscrew the two screws 43 and remove the defective circuit board 23.

10. If you have cut through the tube 49 under point 7., please replace it as follows:
   - Using side nippers, cut through the cable tie 55 at the distributor.
   - Pull off the tube.
   - Slide a new tube 49 onto the distributor and secure with a cable tie.

11. Replace the alarm signalling device (see "6.8 Replacing the alarm signalling device" on page 25).

12. Replace the potentiometer (see "6.8 Replacing the potentiometer", page 26).

13. Place the new circuit board 23 onto the spacer brackets. The points of the spacer brackets snap into the circuit board.
   Make sure that no leads are beneath the circuit board, where they may be pinched.

14. Secure the circuit board with the two short screws 43.

15. Slide the tube 47 onto the sensor B2.

16. Slide the tube 49 onto the sensor B2 and secure it there with a cable tie.

17. Slide the tube 54 onto the lower connection of the sensor B3.
   If you have cut through the tube 54 under point 8., please replace it.

18. Push the connectors X2, X3, X4, and X5 onto the contacts of the circuit board.
19. Connect the connector X1 of the battery to the circuit board and insert the battery into the holder.

20. Place the flat cable into the locking device X7.
    To do so, pull the upper part of the locking mechanism upwards, slide the cable into it, and press the upper part down again.

21. Perform a calibration (see “6.10 Calibration after removal of PCB or Pot 28 (frequency)” on page 28).

22. Close the device (see “6.5 Closing the device” on page 24).

23. Perform a functional check (see “3. Final Check” on page 9).

6.12 Replacing the pressure gauge

**Note:** The pressure gauge is identical to the respiratory pressure meter described in the instructions for use.

**Tools required:**
- Cross-tip screwdriver, size 2,
- Open-ended spanner SW 7,
- If necessary, side nippers,
- If necessary, cable tie.

1. Open the device (see “6.4 Opening the device” on page 23).

2. Unscrew the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 2. to 10.).

   The tubes 47 and 49 may be left on the circuit board.

3. Release the pressure gauge tube 53 by pushing back the sleeve of the swivel screw connection 35 and pulling out the tube.
4. Using an open-ended spanner (SW 7), unscrew the swivel screw connection 35 from the pressure gauge 1.

5. Using your fingers, press the pressure gauge 1 out of its holder.

Tip: You will find the pressure gauge easier to remove if you dribble a small amount of spirit between the pressure gauge and the holder.

6. Wet a new pressure gauge 1 with a small amount of spirit and press it into the holder.

Take care to install the gauge in the right position, so that it is easy to read.

7. Screw the swivel screw connection 35 onto the pressure gauge.

8. Push the pressure gauge tube 53 into the swivel screw connection as far as it will go.

9. Secure the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 13, to 20).

10. Close the device (see “6.5 Closing the device” on page 24).

11. Perform a functional check (see “3. Final Check” on page 9).

6.13 Replacing the pneumatic block

Tools required:

- Cross tip screwdriver, size 2,
- L-handled socket wrench 10 mm,
- Special tool WM 22829 from special tool set WM 15349,
- If necessary, side nippers,
- If necessary, cable tie,
- Calibration device WM 22836

1. Lift off the lid 36 from the control knob for minute volume 37.

2. Using the special tool, hold the control knob 37 steady and loosen the nuts with an L-handled socket wrench 10 mm.

3. Pull off the control knob.

4. Open the device (see “6.4 Opening the device” on page 23).

5. Unscrew the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 2, to 10).

You can leave the pressure measurement tube 49 attached to the circuit board.
6. Pull the tube 47 off the sensor B2.
7. Pull the ventilation tube 46 with the spring 57 from the pneumatic block 25.
8. Pull the suction connector 45 from the pneumatic block 25.
9. Release the pressure tube 50 by pushing back the sleeve of the inlet and pulling out the tube.
10. Carefully pull the defective pneumatic block upwards out of the housing.
11. Pull off the two grommets 41.

12. Take a new pneumatic block 25 push the grommets written side first onto the connection 13 and the valve 15.

13. Insert the new pneumatic block into the housing.

Make sure,
- That you push the rocker and the spindle through the corresponding holes in the housing
- That no tubes or leads are underneath the pneumatic block where they may be pinched
- That the grommets are positioned correctly in the housing wall (the housing wall must be in the groove)
- That the pneumatic block is resting on the four rubber buffers.

14. Slide the suction connector 45 and the ventilation tube 46 with the spring 57 onto the corresponding connections on the pneumatic block 25 as far as they will go.
15. Slide the pressure tube 50 into the inlet of the pneumatic block as far as it will go.

16. Secure the circuit board (see „6.11 Replacing the circuit board“ on page 29, steps 13 to 20).)
18. Close the device (see „6.5 Closing the device“ on page 24).
19. Turn the MEDUMAT Standard a round
20. Secure the control knob 37:
   - Slide the control knob onto the spindle as far as it will go.
   - Hold the knob steady with the special tool and screw it down.

21. Check the display on the control knob: At the left limit, the white line must indicate the value 3.
    If this is not the case, loosen the nuts and align the control knob.

22. Perform a calibration (see “6.10 Calibration after removal of PCB or Pot 28 (frequency)” on page 28).

23. Place the lid 36 on the control knob 37

24. Perform a functional check (see “3. Final Check” on page 9).

6.14 Replacing the pneumatic block with angled outlet

The pneumatic block with angled outlet is fitted as standard to MEDUMAT Standard a from appliance No. 1670 onward. Old appliances should be converted not later than the 6-year service.

Tools required:
- Cross-tip screwdriver, size 2
- L-handled socket wrench 10 mm
- Special tool WM 22829 from special tool set WM 15349
- If necessary, side nippers
- If necessary, cable tie
- Calibration device WM 22836
- Special pliers WM 22928

1. Lift off the lid 36 from the control knob for minute volume 37.

2. Using the special tool, hold the control knob 37 steady and loosen the nuts with an L-handled socket wrench [10 mm].

3. Pull off the control knob 37.

4. Open the device (see “6.4 Opening the device” on page 23).

5. Pull the tube 47 off the sensor B2

6. Unscrew the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 2 to 10.)

You can leave the pressure measurement tube 49 attached to the circuit board.
7. Pull the ventilation tube \textit{46} with the spring \textit{57} from the pneumatic block \textit{25}.
8. Pull the suction connector \textit{45} from the pneumatic block \textit{25}.
9. Release the pressure tube \textit{50} by pushing back the sleeve of the inlet and pulling out the tube.
10. Carefully pull the defective/old pneumatic block upwards out of the housing.
11. Pull off the grommet \textit{41} from the pneumatic block \textit{25}.

For conversion of appliances up to No. 1669: go to step \textbf{12}.
For replacement in appliances from No. 1670 onward: go to step \textbf{14}.

12. Pull tube \textit{51} off the T-piece and replace it with the new tube \textit{52} [use WM 22967].
13. Route the tube so that it is below the valve insert locator and the alarm unit \textit{24} and run it along the inside wall of the housing.

14. Take a new or replacement pneumatic block \textit{25} and push the grommet \underline{written side first} onto valve \textit{15}.
15. Insert the new pneumatic block into the housing and push tube \textit{52} onto the pneumatic block.

16. Now take the swivelling angled connector and push it onto the connector of the pneumatic block. To fit the swivelling angled connector properly into the upper housing section, lift the pneumatic block slightly and push it over the outer wall of the housing.

\textbf{Make sure,}
- That you push the rocker and the spindle through the corresponding holes in the housing
- That no tubes or leads are underneath the pneumatic block where they may be pinched
- That the grommet is positioned correctly in the housing wall [the housing wall must be in the groove]
- That the pneumatic block is resting on the four rubber buffers.

For conversion: go to step \textbf{17}.
For replacement: go to step \textbf{19}.
17. Where present: If you have a device that you have converted to a swivelling angled connector, you must insert sealing plug WM 22809 with O-ring 5-1.2 WM 1145/90 into the upper part of the housing where the pressure sensor tube was previously fitted.

18. Remove the "Sensor" plate from the housing.

19. Slide the suction connector 45 and the ventilation tube 46 with the spring 57 onto the corresponding connections on the pneumatic block 25 as far as they will go.

20. Slide the pressure tube 50 into the inlet of the pneumatic block as far as it will go.

21. Secure the circuit board (see "6.1.1 Replacing the circuit board" on page 29, steps 13 to 20).

23. Close the device (see "6.5 Closing the device" on page 24).

24. Turn the MEDUMAT Standard a round.

25. Secure the control knob 37:
   - Slide the control knob onto the spindle as far as it will go.
   - Hold the knob steady with the special tool and screw it down.

26. Check the display on the control knob: At the left limit, the white line must indicate the value 3. If this is not the case, loosen the nuts and align the control knob.

27. Perform a calibration (see "6.10 Calibration after removal of PCB or Pot 28 (frequency)" on page 28).

28. Place the lid 36 on the control knob.

29. Perform a functional check (see "3. Final Check" on page 9).
6.15 Changing the Air Mix/No Air Mix switch

Tools required:
• Cross-tip screwdriver, size 2,
• L-handled socket wrench 10 mm,
• Open-ended spanner SW 17,
• Special tool WM 22829 from special tool set WM 15349,
• If necessary, side nippers,
• If necessary, cable tie,
• Vice with protective jaws,
• Calibration device WM 22836.

1. **Up to appliance no. 1669:**
   Remove the pneumatic block from the housing
   (see "6.13 Replacing the pneumatic block" on page 32, steps 1. to 10.).
   **From appliance no. 1670:**
   Remove the pneumatic block from the housing
   (see "6.14 Replacing the pneumatic block with angled outlet" on page 34, steps 1. to 10.)

2. Clamp the pneumatic block in a vice with protective jaws.

3. Unscrew the rocker using an open-ended spanner (SW 17).

4. Screw in a new rocker 27 with the seal.
   **Take care to ensure the correct installation position:**
   The rocker must drop automatically into its end position. It must not become stuck in an intermediate position.

   **Note:**
   The rocker will tend to drop into the lower position.

5. **Up to appliance no. 1669:**
   Reinstall the pneumatic block (see "6.13 Replacing the pneumatic block" on page 32, steps 13. to 23.).
   **From appliance no. 1670:**
   Reinstall the pneumatic block (see "6.14 Replacing the pneumatic block with angled outlet" on page 34, steps 15. to 28.).

6. Perform a functional check (see "3. Final Check" on page 9).
6.16 Replacing the upper housing section

Tools required:
- Cross tip screwdriver, size 2.
- Cross tip screwdriver, size 1.
- L-handled socket wrench 10 mm.
- Special tool WM 22829 from special tool set WM 15349.
- Flat nose pliers.
- Side nippers.
- Cable tie.
- Calibration device WM 22836.

1. Remove the three control knob 5, 8 and 10. Please proceed as follows for each knob:
   - Twist the control knob 37 to the left limit so that you have a reference point when you come to re-assemble it.
   - Lift off the lid 36.
   - Using the special tool, hold the control knob steady and loosen the nuts with an L-handled socket wrench (10 mm).
   - Pull off the control knob 37.

2. Open the device (see “6.4 Opening the device” on page 23).

3. Remove the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 2 to 10.).

   The pressure measuring tube 49 may be left on the circuit board.

5. Pull the ventilation tube 46 with the spring 57 from the pneumatic block 25/26 and the filter holder.

6. Pull the suction connector 45 from the pneumatic block 25/26 and the filter holder.

7. Release the pressure tube 50 by pushing back the sleeve of the inlet and pulling out the tube.

8. Carefully pull the pneumatic block upwards out of the housing.

10. Release the pressure gauge tube 53 by pushing back the sleeve of the swivel screw connection 35 and pulling out the tube.

11. Using your fingers, press the pressure gauge 1 out of the pressure gauge holder.

Tip:
You will find the pressure gauge easier to remove if you dribble a small amount of spirit between the pressure gauge and the holder.

12. Press the pressure gauge holder out of the housing.

13. Pull the latch 12 out of the housing wall.

14. Unscrew the four screws 43 and remove the two potentiometers 28 and 29.

15. For conversion up to appliance No. 1669:
Pull the pressure measurement connection 14 upwards out of the housing wall.

16. Unscrew both the screws 44 and remove the alarm signalling device 24.

17. For conversion up to appliance No. 1669:
The pressure measuring tube 51 is secured to the housing with a cable tie. Cut through the cable tie with side nippers and remove carefully the tube or pull the tube with the cable tie.

18. Remove the filter insert:
   - Pull the filter cap 56 out of the housing wall.
   - Using a screwdriver, press out the pin 63.

   - Take the valve insert 59 out of the receptacle in the housing e.g. by tilting it with a small screwdriver then pulling it out with flat nose pliers.

19. Finally, remove the four rubber buffers 40.
You have now removed all the components. Now start assembly.

20. If your MEDUMAT Standard a is not to be updated (straight connection on pneumatic block), you will first have to file away a semi-circle for the pressure measurement connection 14.

21. Push the pressure gauge mounting 22 into the new upper housing section 21.

22. Wet the rubber buffers 40 with a little spirit and insert them.

23. Install the filter insert:
   - Insert O-ring 62 in the corresponding groove in the valve insert.
   - Check that the membrane 61 is lying flush and smooth against the valve insert 59.
   - Press the valve insert, membrane first, into the filter holder.
   After installing, make sure that the valve insert is lying straight in the holder.
   - Take the pin 63 in your hand. The pin has a notched side and a smooth side. Press the pin with the smooth side forwards into the small hole on the top of the filter holder until it is flush with the holder. The pin holds the valve insert in position.
   - Push the filter cap into the housing wall.

24. Wet the pressure gauge 1 with a small amount of spirit and press it into the holder.
   Observe the installation position so that the display remains clearly legible.

25. Push the pressure gauge tube 53 into the swivel screw connection 35 as far as it will go.

26. Place the pressure gauge tube 53 and the pressure measuring tube 51/52 into the housing as illustrated.

27. For conversion up to appliance No. 1669:
   Secure the pressure measuring tube to the middle spacer with a cable tie.
28. Push the latch 12 into the housing wall.
   Remember that the slanted surface needs to be
   pointing towards the device base later.

29. Install both potentiometers 28 and 29:
   - Grease the spindles with oxygen lubricant.
   - Push the spindle of the potentiometer
     through the rubberised opening
   - Secure the potentiometer using the screws 43.

30. Insert the alarm signalling device 24 and se-
    cure it with the screws 44.

31. For conversion up to appliance No. 7253:
    Push the connection 14 into the housing wall.

32. Insert the new pneumatic block into the
    housing.

    Make sure
    - That you push the rocker and the spindle
      through the corresponding holes in the
      housing
    - That no tubes or leads are underneath the
      pneumatic block where they may be
      pinched
    - That the grommet is positioned correctly in
      the housing wall [the housing wall must be
      in the groove]
    - That the pneumatic block is resting on the
      four rubber buffers.

33. Make the tube connections:
   - Push the suction connector 45 onto the rear
     nozzle of the filter holder and onto the con-
     nection on the pneumatic block 25
   - Using the ventilation tube 46 with the
     spring 57, connect the front nozzle of the fil-
     ter holder to the pneumatic block 25
   - Make sure that all the tube ends are pushed
     on to the limits.
34. For conversion from appliance No. 1670 onward:
   Slide pressure measurement tube 52 onto the tube connection of the angled outlet.
35. Slide the pressure tube 50 into the inlet of the pneumatic block as far as it will go.
37. Secure the circuit board (see “6.11 Replacing the circuit board” on page 29, steps 13 to 20.).
38. Secure the three control knobs 5, 8 and 10. Please proceed as follows for each knob:
   - Push the control knob 37 onto the spindle just short of the limit.
   - Twist the knob until the white line is pointing to the lowest value.
   - Hold the knob steady with the special tool and screw it down.
39. Check the display on the control knobs: At the left limit, the white line must indicate the lowest value.
   If this is not the case, loosen the nuts and align the control knob.
40. Place the lid 36 on the control knob.
41. Perform a calibration (see “6.10 Calibration after removal of PCB or Pot 28 (frequency)” on page 28).
42. Close the device (see “6.5 Closing the device” on page 24).
43. Turn the MEDUMAT Standard a round.
44. Perform a functional check (see “3. Final Check” on page 9).
6.17 Replacing the housing base section

Tools required:

- Cross-tip screwdriver, size 2,
- Open-ended spanner SW 13,
- Open-ended spanner SW 22,
- Special locknut tool G 3/8 WM 22827 and special spanner SW 17 WM 22828 from the special tool set WM 15349,
- Vice with protective jaws.

1. Open the device [see “6.4 Opening the device” on page 23].
2. Screw the special locknut tool onto the compressed gas connection 11.
3. Clamp the special locknut tool in a vice.
4. Tighten the nuts of the special locknut tool against the pressure connection using an open-ended spanner [SW 22].
5. Unscrew the angular bush 31 using an open-ended spanner [SW 13].
6. Using the special spanner [SW 17], loosen the nut 32 and unscrew it.
7. Pull out the plate 33 upwards.
8. Remove the housing base section 30.
9. Remove rubber buffer 39 from the old device.
10. Place a new housing base section 30 on the compressed gas connection 11.
11. Slide the plate 33 on the inside of the housing onto the connection.
12. Tighten the nut 32 on the inside of the connection.
13. Secure the angular bush 31 to the connection.
14. Loosen the nuts of the special locknut tool using the open-ended spanner [SW 22].
15. Open the vice.
16. Unscrew the special locknut tool from the compressed gas connection 11.
17. If your MEDUMAT Standard a is not to be updated [straight connection on pneumatic block], you will first have to file away a semicircle for the pressure measurement connection 14.
18. Moisten the rubber buffers 39 of the defective housing with a little spirit and insert them in the new housing.
19. Close the device [see “6.5 Closing the device” on page 24].
20. Perform a functional check [see “3. Final Check” on page 9].
# 7. Spare parts

## 7.1 List of spare parts

Note:

The item numbers in the following table match the numbers in the text of these service and repair instructions and the operating instructions.

<table>

Maintenance set 2 years
Set, WM 15242
consisting of:
- Battery
- Button cell
- Dust filter
- Foam insert for pressure relief valve
- Lip membranes
- Membrane for spontaneous breathing arm
- Seal 3.5 x 6 x 0.5
- Sieve
- Membrane for expiration arm
- O-ring 15 x 1.5
- Valve membrane

Maintenance set 8 years
Set, WM 15552
consisting of:
- Set WM 15242
- Rubber buffer pad
- Rubber buffer receptacle
- Set of tubes
- Potentiometer
- Pneumatic block, replacement
- Suction connector
- O-ring 13 x 1.25
- Sealing plug
- O-ring 5 x 1.2

Maintenance set 12 years
Set, WM 15553
consisting of:
- Set WM 15242
- Printed circuit board / PCB
  MEDUMAT Standard a
- Alarm signalling device
- Cable tie
Maintenance set (14) 16 years

Set,
WM 15708
consisting of:

- Set WM 15242
- Rubber buffer pad
- Rubber buffer receptacle
- Set of tubes
- Potentiometer
- Pneumatic block
- Suction connector
- O-ring 13 x 1.25
- Sealing plug
- O-ring 5 x 1.2
8. Tools and test equipment

Below is a list of all tools and test equipment used in these service and repair instructions. The particular tools and test equipment required are outlined in the respective chapter. Special tools can be purchased from the manufacturer Weinmann.

8.1 General tools

- Slotted screwdriver size 0.5 x 3 x 100;
- Cross tip screwdriver, size 1;
- Cross tip screwdriver, size 2;
- Open ended spanner SW 7 for tube connection of pressure gauge;
- Open ended spanner SW 13, for elbow connector at O₂ inlet;
- Open ended spanner SW 17 for rocker valves;
- Open ended spanner SW 22 for special locknut tool;
- L-handled socket wrench 10 mm for control knob;
- Tweezers for sieve set;
- Side nippers;
- Flat nose pliers.

8.2 Special tools

The following tools are available from the manufacturer Weinmann:

- Special tool set, consisting of: WM 15349
  - Special lock nut tool G 3/8 WM 22827
    for unlocking the threaded connection on the O₂ inlet
  - Special spanner SW 17 WM 22828
    for lock nut on O₂ inlet
  - Special tool WM 22829
    for holding the control knob
  - Set, hose with injector WM 15359
  - Special pliers WM 22928
- Set, supply test Medumat / Modules WM 15440
- Set, test set respiration and pressure reducer flow WM 15443
- Calibration device WM 22836
8.3 Test equipment

- Oxygen concentration measuring device Type Miniox WM 91810, or Oxycontrol WM 13550
- Volumetric flowmeter
  **Type RT 200 (Timeter)**
  obtainable from:
  Allied Healthcare Products Inc.
  1720 Sublette Avenue
  St. Louis, Missouri, MO 63110
  USA
  Tel.: 001-800-444-3954
  Fax: 001-314-771-5183
  or
  **Type EKU VIP-Ventilatortester**
  obtainable from:
  EKU Elektronik GmbH
  Feldstrasse 9a
  56291 Leiningen
  Tel.: 06746-1018
  Fax: 06746-8484
  www.ekuelektronik.de
- Test set for final check WM 15382
- Adjustable orifice, e.g. ball valve, internal diameter ≥ 10 mm
- Pressure gauge 0 to 6.3 bar, class 1.6;
- Pressure gauge 0 - 100 mbar, class 1.6
  **Type WIKA**
  obtainable from:
  Alexander Wiegand GmbH & Co.
  Alexander-Wiegand-Straße 30
  63911 Klingenberg am Main

9.1 Pneumatics

The input pressure at p is max. 6 bar. This is reduced by V1 to 2.7 bar dyn. This is the input pressure at V6, V2 and V3.

Inspiration/No Air Mix

Valve rocker V6 is opened and switches over V7. An electrical impulse to V2 opens V3 and closes V4. Oxygen flows through V5 into injector unit V9 and onwards to the patient valve. If the ventilation pressure in the patient valve rises above 100 mbar, the relief valve V8 will open.

Inspiration/Air Mix

Valve rocker V6 is closed. This closes V7. O₂ flows into injector unit V9 through V5 and sucks in air through V7. The air-oxygen mixture flows to the patient valve.

Expiration/Air Mix or No Air Mix

Another electrical impulse closes V2. Exhaust valve V4 opens and exhausts injector unit V9. The patient breathes out through the patient valve.

Patient valve

The respiratory gas flows into the patient’s airways during inspiration. The expiratory pressure then switches the valve over and enables the patient to breathe out.
9.2 O₂ content when using Air Mix

The following diagram shows the oxygen concentration prevailing at various counter-pressure and minute volumes when Air Mix is switched on.

In isolated cases the minute volume (MV) deviations may be higher at ventilation pressures in excess of 30 mbar.

</table>
1. Test equipment
   - Test pressure: 6 ± 15 bar; pressure gauge 0 - 63 bar, class 1.6
   - Volumetric flow measuring device RT 2000; adjustable diaphragm 10 mbar, test set WM 13592
   - Oxygen measuring device

2. Preparation for testing
   - Connect MEDUMAT to the test unit.
   - Set MEDUMAT to the “No Air Mix” setting at f = 40/l/min, MV = 5 l/min and p_{exc} = 60 mbar.

3. Input the device data
   - Enter the above device data

4. Leak tests at 6 bar
   - Pressure drop, inlet side with lever set to “No Air Mix” ≤ 0.2 bar/min
   - Pressure drop, inlet side with lever set to “Air Mix” ≤ 0.2 bar/min
   - Pressure drop in pressure measuring segment ≤ 2.0 mbar/min
   - Pressure reading deviation less than ± 2.5 mbar

5. Self-test after switching on the device
   - All 6 LEDs are illuminated simultaneously and the alarm sounds

6. Functional check and alarms
   - With lever set to “Air Mix”, Stenosis alarm is triggered
   - With lever set to “No Air Mix”, Stenosis alarm is triggered
   - Alarm acknowledgement function
   - Disconnection alarm is triggered
   - Pressure alarm is triggered

7. Functional check assisted ventilation (Assist function)
   - Green LED flashes after activation of Assist function
   - “No Assist” alarm is activated
   - Assist function correct (triggering / no triggering)

8. Frequency check – frequency setting
   - Frequency 5 / min ± 2
   - Frequency 15 / min ± 2
   - Frequency 25 / min ± 2
   - Frequency 40 / min ± 2

9. Tidal volume check at 4.5 bar admission pressure and 10 mbar counterpressure
   - f = 15 / min, MV = 20 l/min, AV = 1300 ± 200 ml
   - f = 15 / min, MV = 11 l/min, AV = 730 ± 110 ml
   - f = 40 / min, MV = 5 l/min, AV = 125 ± 25 ml

10. Check O₂ concentration at f = 10 / min and MV = 11 l/min
    - O₂ concentration with “No Air Mix” > 98 Vol %
    - O₂ concentration with “Air Mix” > 50 - 65 Vol %

11. Functional check – pressure limit with No Air Mix
    - Pressure limit responds at 20 ± 5 mbar, f = 8 / min and MV = 9 l/min
    - Pressure limit responds at 60 ± 5 mbar, f = 8 / min and MV = 7 l/min

12. Functional check – ventilation valve without patient valve at f = 8 / min and MV = 7 l/min
    - Test bag is inflated completely; respirator is then vented audibly.

13. Check the equipment and accessories (system components)
    - Respiration tube with patient valve undamaged and fully functional
    - Test set for functional check fully functional
    - Pressure-reducer fully functional
    - O₂ cylinder within the inspection limits, valve fully functional
    - Support plate complete and fully functional
    - Medical product book
    - Instructions for use

14. Check external condition
    - Zero setting of manometer
    - Connection thread and knobs fully functional
